

ST7628

## 65K Color Dot Matrix LCD Controller/Driver

## 1. INTRODUCTION

The ST7628 is a driver & controller LSI for 65K color graphic dot-matrix liquid crystal display systems. It generates 294 Segment and 70 Common driver circuits. This chip is connected directly to a microprocessor, accepts Serial Peripheral Interface (SPI) or 8-bit/16-bit parallel display data and stores in an on-chip display data RAM. It performs display data RAM read/write operation with no external operating clock to minimize power consumption. In addition, because it contains power supply circuits necessary to drive liquid crystal, it is possible to make a display system with the fewest components.

## 2. FEATURES

## **Driver Output Circuits**

♦ 294 Segment Outputs / 70 Common Outputs

### **Applicable Duty Ratios**

- Various Partial Display
- ◆ Partial Window Moving & Data Scrolling

#### **Gray-Scale Display**

- 4FRC & 31 PWM function circuit to display 64 gray-scale display
- ◆ Support 8 color mode (Idle mode)

#### **On-chip Display Data RAM**

◆ Capacity: 98 x 70 x 16 =109,760 bits

#### Color support by Interface

- ◆ 256 color mode (via LUT)
- ♦ 4K color mode (via LUT)
- ♦ 65K color mode
- ◆ Truncated 262K color mode
- ◆ Truncated 16M color mode

#### **Microprocessor Interface**

- 8/16-bit parallel bi-directional interface with 6800-series or 8080-series
- ◆ 4-line serial interface

♦ 3-line (9-bits) serial interface

## **On-chip Low Power Analog Circuit**

- ♦ On-chip Oscillator Circuit
- On-chip Voltage Converter (x2, x3, x4, x5, x6, x7, X8)
   with internal booster capacitors.
- Extremely Few Outsider Components. (Required outsider components: Three Capacitors)
- ♦ On-chip Voltage Regulator
- ♦ On-chip Electronic Contrast Control Function
- ♦ Voltage Follower (LCD bias: 1/5~1/12)

## **Operating Voltage Range**

- ◆ Supply Digital Voltage (VDD): 1.65 to 3.0V
- Supply Analog Voltage (VDD2, VDD3, VDD4, VDD5):
   2.4 to 3.3V
- ◆ LCD Driving Voltage (VOP = V0 VSS): Max to 18V

## LCD Driving Voltage (OTP)

 Contrast Adjustment Value is stored in the Built-In OTP-ROM for better display quality.

#### LCD Driving setting suggestion

◆ LCD Driving Voltage (VOP = 11.72V), BIAS=1/8.

#### Package Type

Application for COG

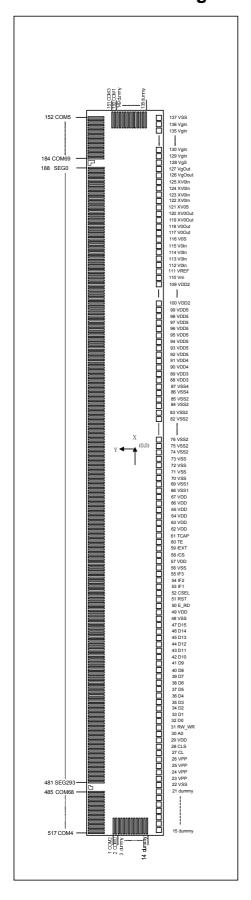

**ST7628** 

6800, 8080, 4-Line, 3-Line interface

# 3. ST7628 Pad Arrangement (COG)

## Chip Size:

10070 um x 780 um

## **Bump Pitch:**

PAD 1~2, 3~14 pitch=27um(min, com/seg)

PAD 138~149, 150~517 pitch=27um(min, com/seg)

PAD 2~3, 149~150 pitch=28.79um(min, com/seg)

PAD 15 ~ 28, 29~137 pitch=80um (I/O)

PAD  $28\sim29$  pitch = 79.72um(I/O)

## **Bump Size:**

PAD 1 ~ 14, PAD 138 ~ 517

Bump width=14um(min, com/seg)

Bump space=13um(min, com/seg)

Bump length=128um(min, com/seg)

Bump area=1800um<sup>2</sup>(com/seg)

PAD 15 ~28, 29~137

Bump width=65um(I/O)

Bump space=15um(I/O)

Bump length=63um(I/O)

Bump area=4095um^2

PAD 28~29

Bump width=65um(I/O)

Bump space=14.72um(I/O)

Bump length=63um(I/O)

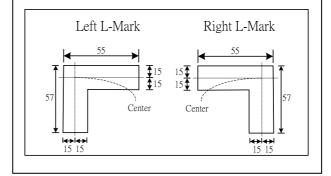

Bump area=4095um^2

Bump Height: 15 um

Chip Thickness: 400 um

## Alignment mark

The center of alignment mark: see bellow Table

# 5. BLOCK DIAGRAM

# 6. PIN DESCRIPTION

# **6.1 POWER SUPPLY**

Name	I/O	Description				
VDD	Supply	Power supply for logic circuit (Digital VDD 1.65V~3.0V)				
VDD2	Supply	Power supply for Booster Circuit (Analog VDD 2.4V~3.3V)				
VDD3	D3 Supply Power supply for LCD. (Analog VDD 2.4V~3.3V)					
VDD4	Supply	Power supply for LCD. (Analog VDD 2.4V~3.3V)				
VDD5	Supply	Power supply for LCD. (Analog VDD 2.4V~3.3V)				
VSS	Supply	Ground for logic circuit. Ground system should be connected together.				
VSS1	Supply	Ground for OSC circuit. Ground system should be connected together.				
VSS2	Supply	Ground for Booster Circuit. Ground system should be connected together.				
VSS4	Supply	Ground for LCD. Ground system should be connected together.				

# **6.2 LCD Power Supply Pins**

Name	I/O	Description								
		Positive LCD driver	supply voltages.							
V0 <sub>OUT</sub>		V0 <sub>OUT</sub> is the output	√0 <sub>OUT</sub> is the output voltage of V0 generated by ST7628.							
V0 <sub>IN</sub>	I/O	V0 <sub>IN</sub> is the input pin	$V0_{IN}$ is the input pin of power supply to generate V0 voltage for LCD.							
V0 <sub>S</sub>		V0 <sub>S</sub> is the input pin	of power supply to	sense the V0 voltag	ge.					
		V0 <sub>OUT</sub> · V0 <sub>IN</sub> & V0	s should be connec	ted together.						
		Negative LCD drive	r supply voltages.							
XV0 <sub>OUT</sub>		XV0 <sub>OUT</sub> is the outpu	t voltage of XV0 gei	nerated by ST7628	).					
XV0 <sub>IN</sub>	I/O	XV0 <sub>IN</sub> is the input pi	n of power supply to	o generate XV0 vol	Itage for LCD.					
XV0s		XV0s is the input pi	n of power supply to	sense the XV0 vo	ltage.					
		XV0 <sub>OUT</sub> · XV0 <sub>IN</sub> &	XV0 <sub>S</sub> should be con	nnected together.						
		Bias LCD driver supply voltages.								
		Vg <sub>OUT</sub> is the output voltage of Vg generated by ST7628.

#### ST7628 I/O PIN ITO Resister Limitation

Pin Name	ITO Resister
VDD, VDD2~VDD5, VSS,VSS1,VSS2,VSS4, SI (In serial interface is D0)	<100Ω
$V0_{\text{IN}},V0_{\text{OUT}},V0_{\text{S}},\!XV0_{\text{IN}},XV0_{\text{OUT}},\!XV0_{\text{S}},Vg_{\text{IN}},Vg_{\text{OUT}},\!Vg_{\text{S}},\!Vm$	<300Ω
VPP	<100Ω
A0, E_RD, RW_WR, /CS, D0(parallel interface), D2D15, (SCL), TE	<1ΚΩ
RST	<10ΚΩ
IF[3:1], CLS, CSEL, /EXT	<1ΚΩ
TCAP, CL, VREF	Floating

#### NOTE:

- 1. Make sure that the ITO resistance of COM0  $\sim$  COM69 is equal, and so is it of SEG0  $\sim$  SEG293. These Limitations include the bottleneck of ITO layout.
- 2. To avoid the noise in different power system affect other power system, please separate different power source on ITO layout.
- 3. The V0, XV0 and Vg power circuits have output pins, input pins and a sensor input. To avoid the power noise affects the sensor of the power circuits. The trace should be separated by ITO and should be connected together by FPC.

2008/08

## 7. FUNCTIONAL DESCRIPTION

## 7.1 MICROPROCESSOR INTERFACE

## **Chip Select Input**

/CS pin is chip selection. The ST7628 is active when /CS=L. In serial interface mode, the internal shift register and the counter are reset when /CS=H.

## 7.1.1 Selecting Parallel / Serial Interface

ST7628 has six types of interface with an MPU, which are two serial and four parallel interfaces. This parallel or serial interface is determined by IF pin as shown in Table 7.1.1.

Table 7.1.1Parallel / Serial Interface Mode

I/	F Mod	е		Pin Assignment							
IF3	IF2	IF1	I/F Description	/CS	A0	E_RD	RW_WR	D15 to D8	Used Data Bus	D1	D0
Н	Н	Н	80 serial 16-bit parallel	/CS	A0	/RD	/WR	D15 ~ D8	D7 ~ D2	D1	D0
Н	Н	Г	80 serial 8-bit parallel	/CS	A0	/RD	/WR		D7 ~ D2	D1	D0
Н	L	Н	68 serial 16-bit parallel	/CS	A0	Е	R/W	D15 ~ D8	D7 ~ D2	D1	D0
Н	L	Г	68 serial 8-bit parallel	/CS	A0	Е	R/W		D7 ~ D2	D1	D0
L	Н	Η	8-bit SPI mode (4 line)	/CS	SCL			-		A0	SI
L	Н	L	9-bit SPI mode (3 line)	/CS	SCL			-	-		SI

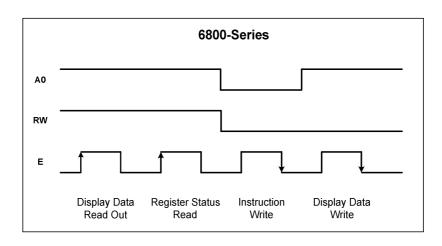

NOTE: When these pins are set to any other combination, A0, E\_RD and RW\_WR inputs are disabled and D0 to D15 are to be high impedance.

#### 7.1.2 8-bit or 16-bit Parallel Interface

The ST7628 identifies the type of the data bus signals according to the combination of A0, /RD (E) and /WR (W/R) signals, as shown in Table 7.1.2.

**Table 7.1.2Parallel Data Transfer** 

Common	6800	)-series	8080-series		Description
A0	R/W	E	/WR	/RD	Description
Н	Н	1	Н	<b>↓</b>	Register status read
Н	Н	1	Н	<b>↓</b>	Display data read out
L	L	<b>↓</b>	1	Н	Instruction write
Н	L	<b>↓</b>	1	Н	Display data write

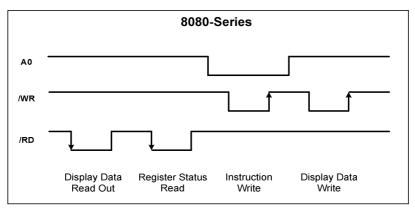

Figure 7.1Parallel Data Transfer Example Chart

## Relation between Data Bus and Gradation Data

The interface of ST7628 supports 256 color display, 4096 color display, 65K color display, truncated 262K color display, and truncated 16M color display.

When using 256, 4096, 65K, 262K, and 16M color display; you can specify color for each of R, G, B using the palette function.

Use the command for switching between these modes.

## (1) 256 color input mode

#### 1. 8-bit interface

D7, D6, D5, D4, D3, D2, D1, D0: RRRGGGBB 1st writes

There is only 1 write operation for 1 pixel data.

1 pixel data is written in the display data RAM when 1st -write operation finishes.

## 2. 16-bit interface

D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: XXXXXXXXXXRRRGGGBB 1st writes

There is only 1 write operation for 1 pixel data.

1 pixel data is written in the display data RAM when 1st -write operation finishes. "X" are ignored dummy bits.

### (2) 4096-color display

## (1-1) Type A 4096 color display

#### 1. 8-bit interface

D7, D6, D5, D4, D3, D2, D1, D0: RRRRGGGG

1st writes

D7, D6, D5, D4, D3, D2, D1, D0: BBBBRRRR

2nd writes

D7, D6, D5, D4, D3, D2, D1, D0: GGGGBBBB

3rd writes

There are 3 write operations for 2 pixel data.

1st pixel data is written in the display data RAM when 2nd –write operation finishes, and 2nd pixel data is written in the display data RAM when 3rd–write operation finishes.

#### 2. 16-bit interface

D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: RRRRGGGGBBBBXXXX

There is only 1 write operation for 1 pixel data.

1 pixel data is written in the display data RAM when 1st -write operation finishes. "X" are ignored dummy bits.

## (1-2) Type B 4096 color display

#### 1. 8-bit interface

D7, D6, D5, D4, D3, D2, D1, D0: XXXXRRRR 1st writes
D7, D6, D5, D4, D3, D2, D1, D0: GGGGBBBB 2nd writes

There are 2 write operations for 1 pixel data.

1st pixel data is written in the display data RAM when 2nd -write operation finishes. "X" are ignored dummy bits.

### 2. 16-bit interface

D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: XXXXRRRRGGGGBBBB

There is only 1 write operation for 1 pixel data.

1 pixel data is written in the display data RAM when 1st -write operation finishes. "X" are ignored dummy bits.

## (3) 65K color input mode

## 1. 8-bit interface

D7, D6, D5, D4, D3, D2, D1, D0: RRRRRGGG 1st writes
D7, D6, D5, D4, D3, D2, D1, D0: GGGBBBBB 2nd writes

There are 2 write operations for 1 pixel data.

1st pixel data is written in the display data RAM when 2nd -write operation finishes.

## 2. 16-bit interface

D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: RRRRRGGGGGGBBBBB 1st writes

There is only 1 write operation for 1 pixel data.

1 pixel data is written in the display data RAM when 1st -write operation finishes.

### (4) Truncated 262K color input mode

#### 1. 8-bit interface

D7, D6, D5, D4, D3, D2, D1, D0: RRRRRXX

1st writes

D7, D6, D5, D4, D3, D2, D1, D0: GGGGGGXX

2nd writes

D7, D6, D5, D4, D3, D2, D1, D0: BBBBBBXX

3rd writes

A single pixel of data is read after the third write operation as shown, and it is written in the display RAM.

"X" is dummy bit, and it is ignored for display.

## 2. 16-bit interface

D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: RRRRRXXGGGGGGXX 1st writes D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: BBBBBBXXXXXXXXXXXXXXXX 2nd writes A single pixel of data is read after the second write operation as shown, and it is written in the display RAM.

#### (5) Truncated 16M color input mode

#### 1. 8-bit interface

D7, D6, D5, D4, D3, D2, D1, D0: RRRRRRR 1st writes
D7, D6, D5, D4, D3, D2, D1, D0: GGGGGGG 2nd writes
D7, D6, D5, D4, D3, D2, D1, D0: BBBBBBBB 3rd writes

A single pixel of data is read after the third write operation as shown, and it is written in the display RAM.

#### 2. 16-bit interface

D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: RRRRRRRGGGGGGGG 1st writes D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: BBBBBBBBXXXXXXXXX 2nd writes A single pixel of data is read after the second write operation as shown, and it is written in the display RAM.

#### 7.1.3 8- and 9-bit Serial Interface

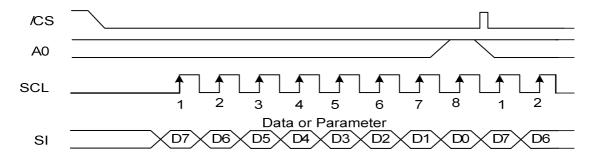

The 8-bit serial interface uses four pins /CS, SI, SCL, and A0 to enter commands and data. Meanwhile, the 9-bit serial interface uses three pins /CS, SI and SCL for the same purpose.

Data read is not available in the serial interface. Data entered must be 8 bits for each time.

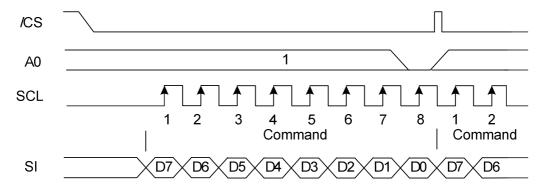

The relation between gray-scale data and data bus in the serial input is the same as that in the 8-bit parallel interface mode at every gradation.

#### (1) 8-bit serial interface (4-line)

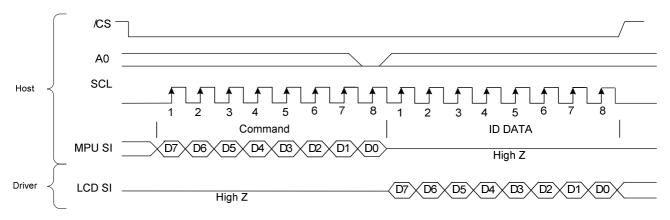

When entering data (parameters): A0= HIGH at the rising edge of the 8<sup>th</sup> SCL.

When entering command: A0= LOW at the rising edge of the 8<sup>th</sup> SCL

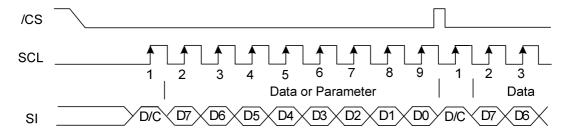

When entering reading command:

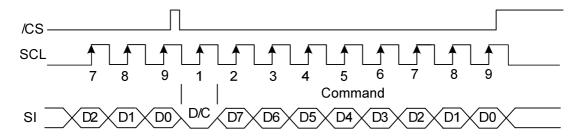

### (2) 9-bit serial interface (3-line)

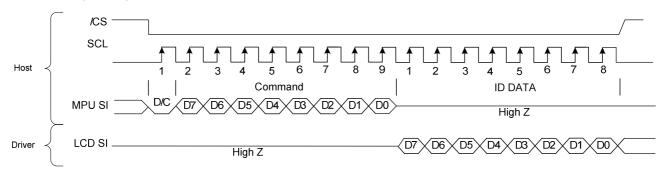

When entering data (parameters): SI= HIGH at the rising edge of the 1st SCL.

When entering command: SI= LOW at the rising edge of the 1st SCL.

When entering reading command:

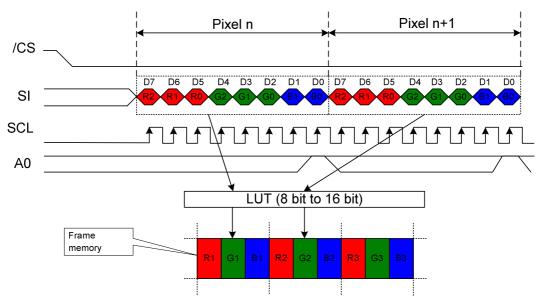

- If /CS is set to HIGH while the 8 bits from D7 to D0 are entered, the data concerned is invalidated. Before entering succeeding sets of data, you must correctly input the data concerned again.
- In order to avoid data transfer error due to incoming noise, it is recommended to set /CS at HIGH on byte basis to initialize the serial-to-parallel conversion counter and the register
- When executing the command RAMWR, set /CS to HIGH after writing the last address. The internal shift register and the counter are reset when /CS =H.

## 7.1.4 8-bit and 9-bit Serial Interface Data Color Coding

## 8-bit serial interface (4-line)

(1) R 3-bit, G 3-bit, B 2-bit, 256 colors

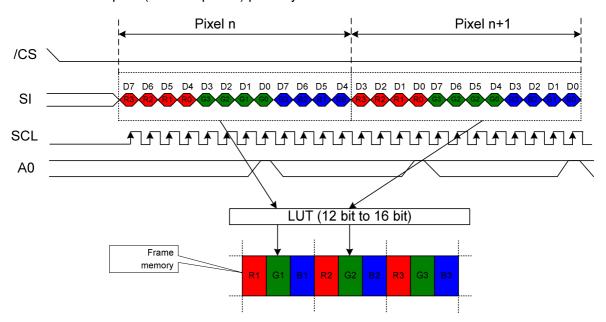

There is 1 pixel ( = 3 sub-pixels ) per byte.

Note: R2, G2, B1 are the most significant bits and R0, G0, B0 are the least significant bits.

## (2) R 4-bit, G 4-bit, B 4-bit, 4,096 colors - Type A

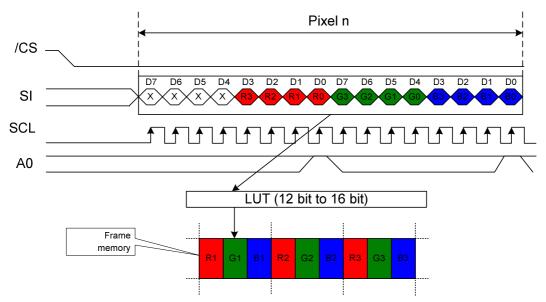

There are 2 pixel ( = 3 sub-pixels ) per 3 byte.

Note: R3, G3, B3 are the most significant bits and R0, G0, B0 are the least significant bits.

## (3) R 4-bit, G 4-bit, B 4-bit, 4,096 colors - Type B

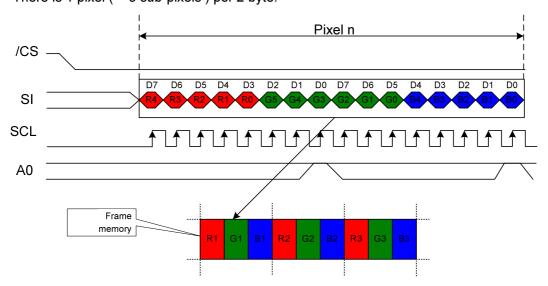

There is 1 pixel ( = 3 sub-pixels ) per 2 bytes.

Note: R3, G3, B3 are the most significant bits and R0, G0, B0 are the least significant bits.

## (4) R 5-bit, G 6-bit, B 5-bit, 65,536 colors

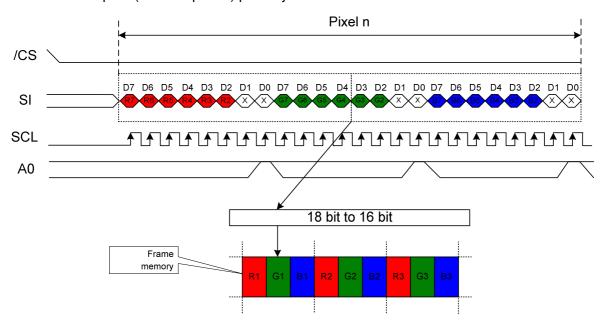

There is 1 pixel ( = 3 sub-pixels ) per 2 byte.

Note: R4, G5, B4 are the most significant bits and R0, G0, B0 are the least significant bits.

### (5) R 6-bit, G 6-bit, B 6-bit, 262k colors

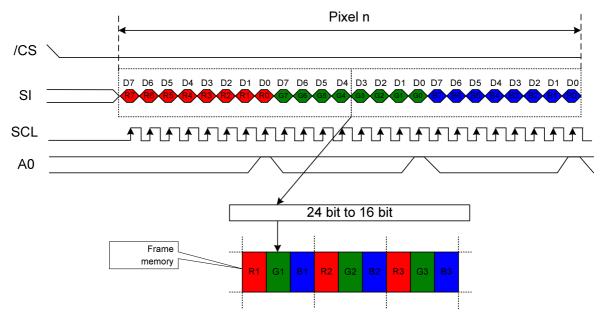

There is 1 pixel ( = 3 sub-pixels ) per 3 byte.

Note: R7, G7, B7 are the most significant bits and R2, G2, B2 are the least significant bits.

## (6) R 8-bit, G 8-bit, B 8-bit, 16M colors

There is 1 pixel ( = 3 sub-pixels ) per 3 byte.

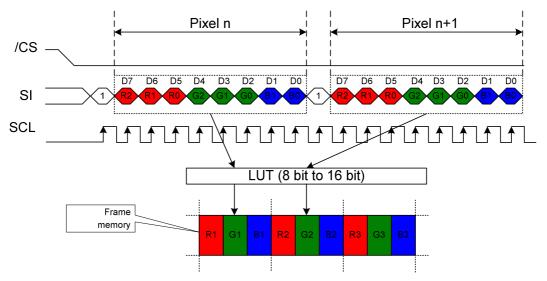

Note: R7, G7, B7 are the most significant bits and R0, G0, B0 are the least significant bits.

## 9-bit serial interface (3-line)

(1) R 3-bit, G 3-bit, B 2-bit, 256 colors

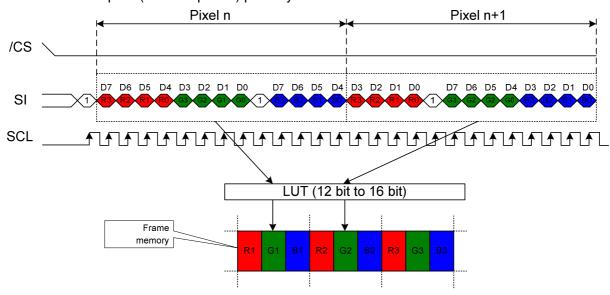

There is 1 pixel ( = 3 sub-pixels ) per byte.

Note: R2, G2, B1 are the most significant bits and R0, G0, B0 are the least significant bits.

## (2) R 4-bit, G 4-bit, B 4-bit, 4,096 colors - Type A

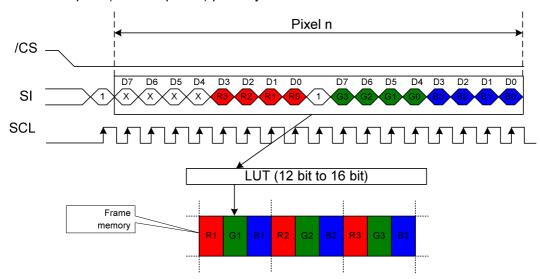

There are 2 pixel ( = 3 sub-pixels ) per 3 byte.

Note: R3, G3, B3 are the most significant bits and R0, G0, B0 are the least significant bits.

## (3) R 4-bit, G 4-bit, B 4-bit, 4,096 colors - Type B

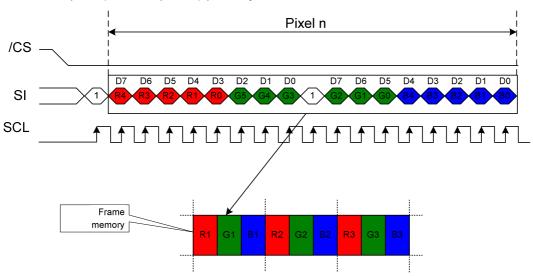

There is 1 pixel ( = 3 sub-pixels ) per 2 bytes.

Note: R3, G3, B3 are the most significant bits and R0, G0, B0 are the least significant bits.

## (4) R 5-bit, G 6-bit, B 5-bit, 65,536 colors

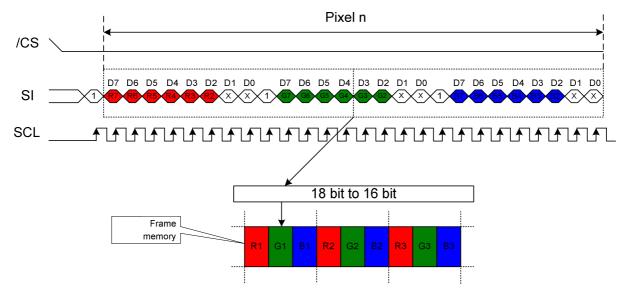

There is 1 pixel ( = 3 sub-pixels ) per 2 byte.

Note: R4, G5, B4 are the most significant bits and R0, G0, B0 are the least significant bits.

## (5) R 6-bit, G 6-bit, B 6-bit, 262k colors

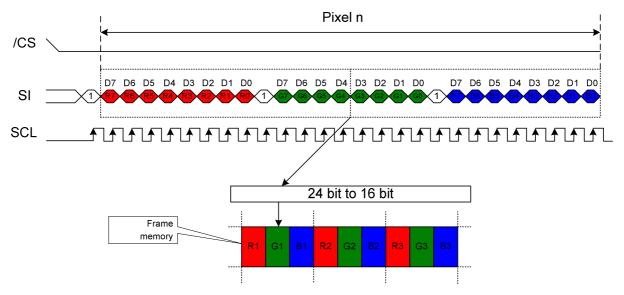

There is 1 pixel ( = 3 sub-pixels ) per 3 byte.

Note: R7, G7, B7 are the most significant bits and R2, G2, B2 are the least significant bits.

## (6) R 8-bit, G 8-bit, B 8-bit, 16M colors

There is 1 pixel ( = 3 sub-pixels ) per 3 byte.

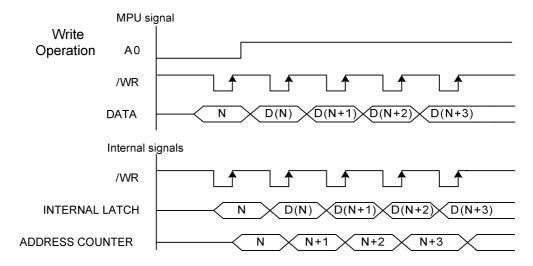

Note: R7, G7, B7 are the most significant bits and R0, G0, B0 are the least significant bits.

## 7.2 ACCESS TO DDRAM AND INTERNAL REGISTERS

ST7628 realizes high-speed data transfer because the access from MPU is a sort of pipeline processing done via the bus holder attached to the internal, requiring the cycle time alone without needing the wait time.

For example, when MPU writes data to the DDRAM, the data is once held by the bus holder and then written to the DDRAM before the succeeding write cycle is started. When MPU reads data from the DDRAM, the first read cycle is dummy and the bus holder holds the data read in the dummy cycle, and then it read from the bus holder to the system bus in the succeeding read cycle. Figure 7.2 illustrates these relations.

## In 80-series interface mode:

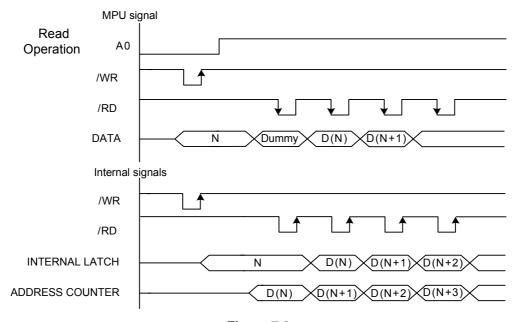

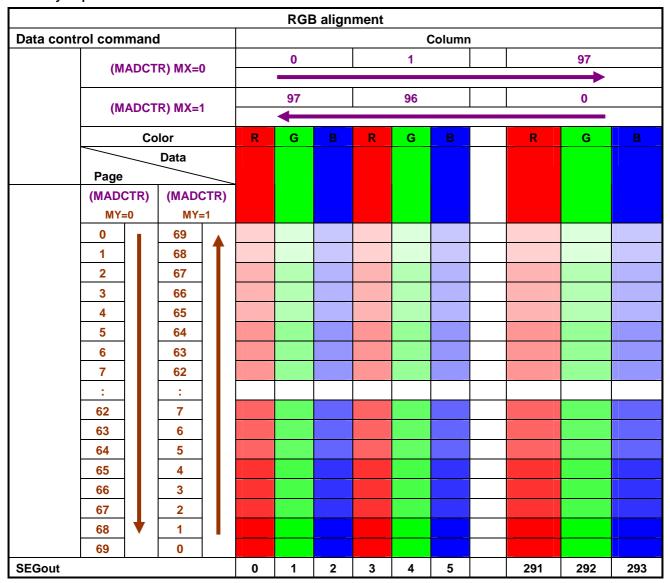

Figure 7.2

## 7.3 DISPLAY DATA RAM (DDRAM)

## 7.3.1 DDRAM

It is 98 X 70 X 16 bits capacity RAM prepared for storing dot data. Refer to the following memory map for the RAM configuration.

## **Memory Map**

You can change position of R and B with MADCTR command.

#### **Address Counter**

The address counter sets the addresses of the display data RAM for writing.

Data is written pixel into the RAM matrix of ST7628. The data for one pixel or two pixels is collected (RGB 5-6-5-bit), according to the data formats. As soon as this pixel-data information is complete, the "Write access" is activated on the RAM. The locations of RAM are addressed by the address pointers. The address ranges are X=0 to X=97 (61hex) and Y=0 to Y=69 (45h). Addresses outside these ranges are not allowed.

Before writing to the RAM, a window must be defined into which will be written. The window is programmable via the command registers XS, YS designating the start address and XE, YE designating the end address.

For example the whole display contents will be written, the window is defined by the following values: XS=0 (0h) YS=0 (0h) and XE=97 (61h), YE=69 (45h).

In vertical addressing mode (MV=1), the Y-address increments after each byte, after the last Y-address (Y=YE), Y wraps around to YS and X increments to address the next column. In horizontal addressing mode (MV=0), the X-address increments after each byte, after the last X-address (X=XE), X wraps around to XS and Y increments to address the next row. After the every last address (X=XE and Y=YE) the address pointers wrap around to address (X=XS and Y=YS). For flexibility in handling a wide variety of display architectures, the commands "CASET, RASET" and "MADCTR" (see section "9.1.31"), define flags MX and MY, which allows mirroring of the X-address and Y-address. All combinations of flags are allowed. Figure 7.3 show the available combinations of writing to the display RAM. When MX, MY and MV will be changed the databus be rewritten to the display RAM.

For each image condition, the controls for the column and row counters apply as below:

Condition	Column Counter	Row Counter
When RAMWR command is accepted	Return to "Start	Return to "Start
	Column (XS)"	Row (YS)"
Complete Pixel Read / Write action	Increment by 1	No change
The Column counter value is larger than "End Column (XE)"	Return to "Start	Increment by 1
	Column (XS)"	
The Column counter value is larger than "End Column (XE)" and	Return to "Start	Return to "Start
the Row counter value is larger than "End Row (YE)"	Column (XS)"	Row (YS)"

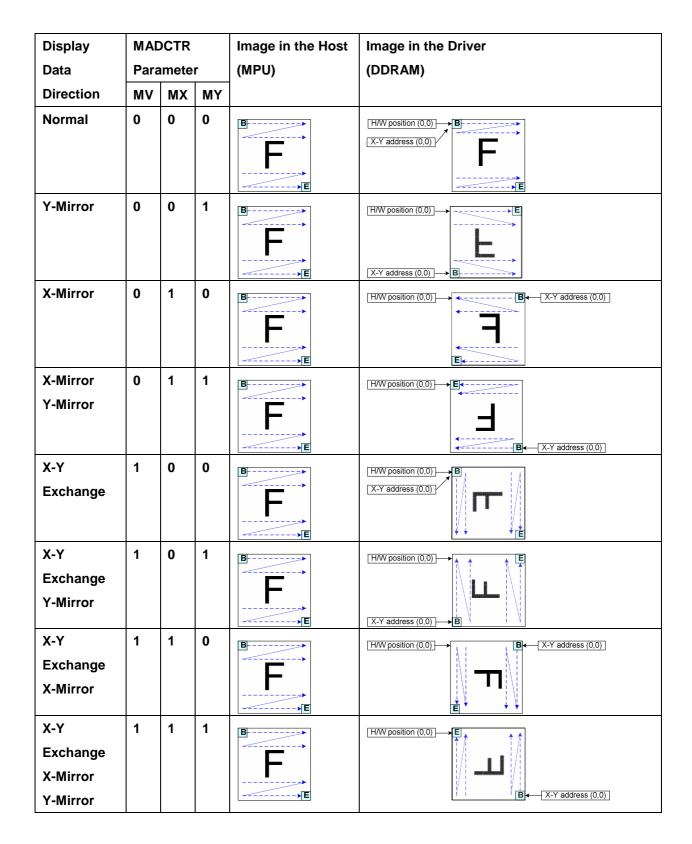

Figure 7.3
Frame Data Write Direction According to the MADCTR parameters (MV, MX and MY)

## ST7628

#### 7.3.3 I/O Buffer Circuit

It is the bi-directional buffer used when MPU reads or writes the DDRAM. Since MPU's read or write of DDRAM is performed independently from data output to the display data latch circuit, asynchronous access to the DDRAM when the LCD is turned on does not cause troubles such as flicking of the display images.

#### 7.3.4 Scroll Address Circuit

The circuit associates lines on DDRAM with COM output. ST7628 processes signals for the liquid crystal display on 1-line basis. Thus, when specifying a specific area in the area scroll display or partial display, you must designate it in line.

## 7.3.5 Display data Latch Circuit

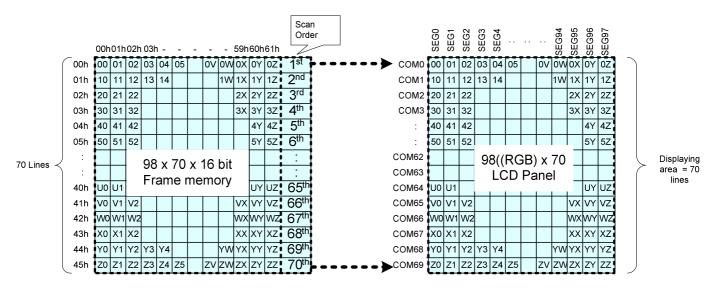

This circuit is used to temporarily hold display data to be output from the DDRAM to the SEG decoder circuit. Since display normal/inverse and display on/off commands are used to control data in the latch circuit alone, they do not modify data in the DDRAM.

## 7.3.6 Normal Display On or Partial Mode On, Vertical Scroll Off

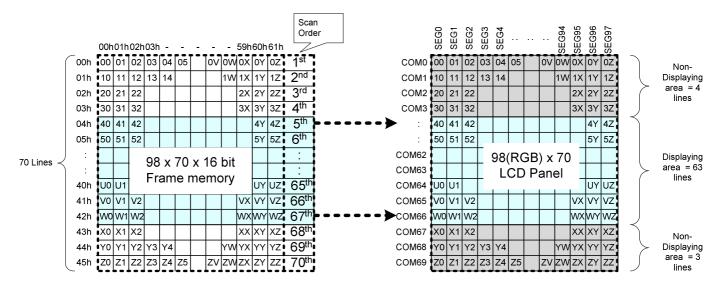

In this mode, contents of the frame memory within an area where column address is 00h to 61h and row address is 00h to 45h is displayed.

To display a dot on leftmost top corner, store the dot data at (column address, row address) = (0,0).

Example1) Normal Display On

Example2) Partial Display On: PSL[6:0] = 04h, PEL[6:0] = 42h, MADCTR (ML)=0

## 7.3.7 Vertical Scroll

#### **Rolling Scroll**

There is just one types of vertical scrolling, which are determined by the commands "Vertical Scrolling Definition" (33h) and "Vertical Scrolling Start Address" (37h).

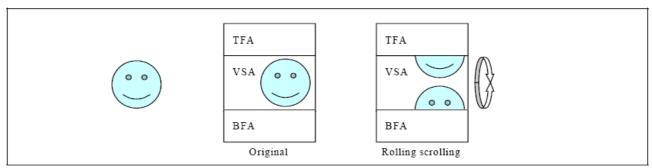

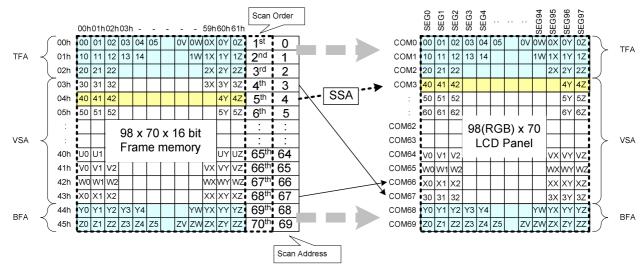

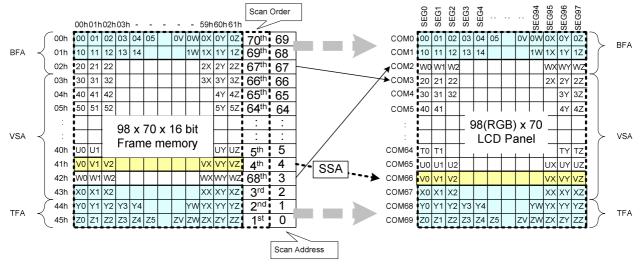

Figure 7.4 Rolling Scroll Definition

When Vertical Scrolling Definition Parameters (TFA+VSA+BFA) =70. In this case, 'rolling' scrolling is applied as shown below. All the memory contents will be used.

Example1) Panel size=98(RGB) x 70, TFA =3, VSA=65, BFA=2, SSA=4, MADCTR (ML) =0: Rolling Scroll

Example2) Panel size=98(RGB) x 70, TFA =3, VSA=65, BFA=2, SSA=4, MADCTR (ML) =1: Rolling Scroll

## **Vertical Scroll Example**

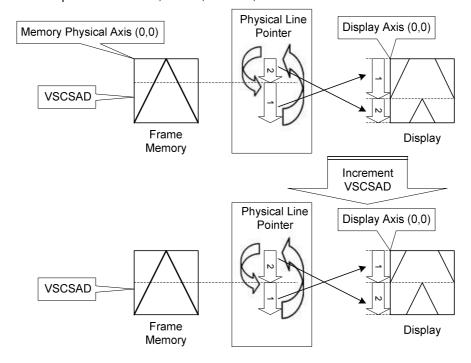

There are 2 types of vertical scrolling, which are determined by the commands "Vertical Scrolling Definition" (33h) and "Vertical Scrolling Start Address" (37h).

Case 1: TFA + VSA + BFA<70

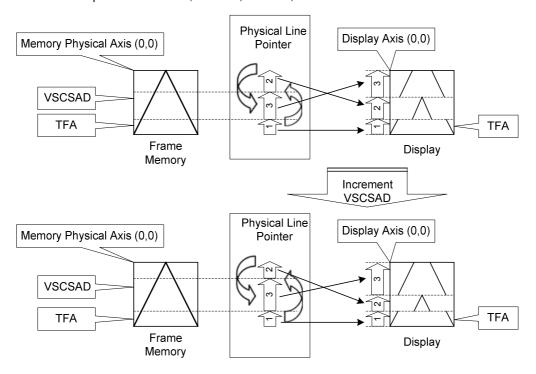

N/A. Do not set TFA + VSA + BFA<70. In that case, unexpected picture will be shown.

Case 2: TFA + VSA + BFA=70 (Rolling Scrolling)

Example1) When MADCTR parameter ML="0", TFA=0, VSA=70, BFA=0 and VSCSAD=40.

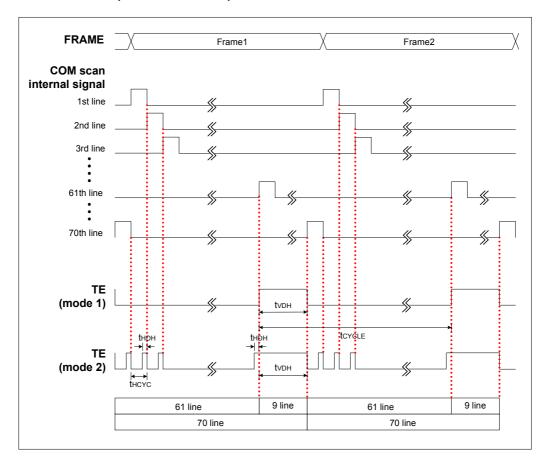

Example2) When MADCTR parameter ML="1", TFA=10, VSA=60, BFA=0 and VSCSAD=30.

## 7.3.8 Tearing Effect Output Line

The Tearing Effect output line supplies to the MPU a Panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line Off & On commands. The signal can be used by the MPU to synchronize Frame Memory Writing when displaying video images.

## Tearing Effect Line Modes(Frame rate=77Hz)

**Mode 1**, the Tearing Effect Output signal consists of V-Sync(tVDH) information. It starts at 61<sup>th</sup> line signal and ends at the 70<sup>th</sup> line signal. There is one high pulse during each frame.

**Mode 2**, the Tearing Effect Output signal consists of both H-Sync(tHDH) and V-Sync(tVDH) information. TE pin output tHDH pulse on each COM scan signal. During  $61^{th} \sim 70^{th}$  line signal, it output a high pulse which equals 1 tHDH + 1 tVDH.

Note: During Sleep In Mode, the Tearing Effect Output Pin is active Low.

## **Tearing Effect Line Timing**

The Tearing Effect signal is described below:

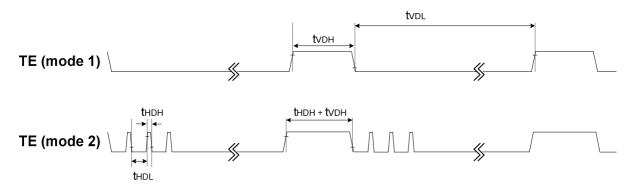

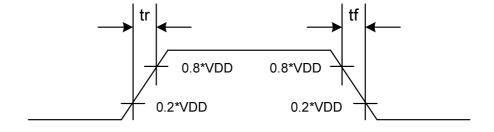

Table 7.3.1 AC characteristics of Tearing Effect Signal

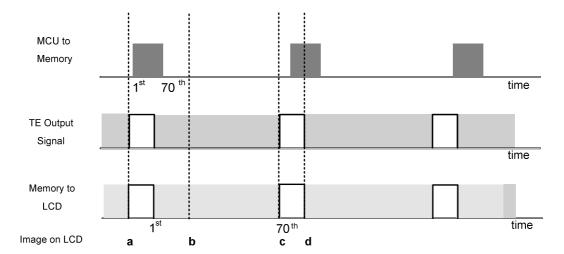

Idle Mode Off (Frame Rate = 77Hz, N-line = 0x01, Vop=12V, VDDI/VDDA=1.8V/2.8V)

Symbol	Parameter	Min	Тур	Max	Unit	description
tvdl	Vertical Timing Low Duration		13		ms	Mode1
tvdH	Vertical Timing High Duration	1	1.6		ms	
tHDL	Horizontal Timing Low Duration		185		us	Mode2
thdh	Horizontal Timing High Duration	11	12		us	

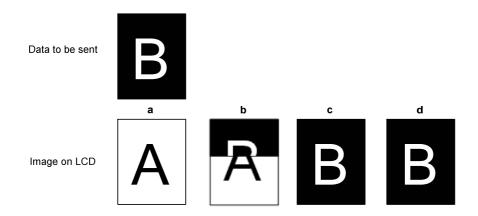

Note: The signal's rise and fall times (tf, tr) are stipulated to be equal to or less than 15ns.

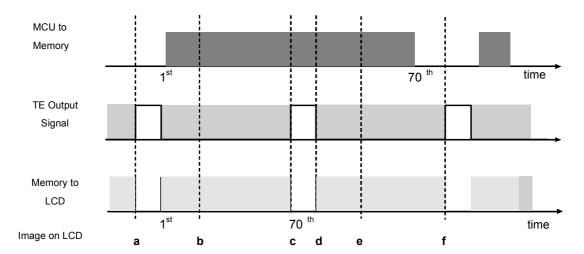

**Example 1: MPU Write is Faster than Panel Read.** 

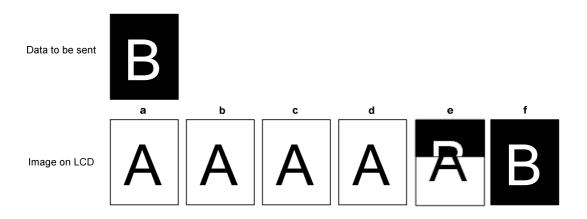

Data write to Frame Memory is now synchronized to the Panel Scan. It should be written during the vertical sync pulse of the Tearing Effect Output Line. This ensures that data is always written ahead of the panel scan and each Panel Frame refresh has a complete new image:

**Example 2: MPU Write is Slower than Panel Read** 

The MPU to Frame Memory write begins just after Panel Read has commenced i.e. after one horizontal sync pulse of the Tearing Effect Output Line. This allows time for the image to download behind the Panel Read pointer and finishing download during the subsequent Frame before the Read Pointer "catches" the MPU to Frame memory write position.

2008/08

## 7.4 Gary-Scale Display

ST7628 incorporates a 4FRC & 31 PWM function circuit to display a 64 gray-scale display.

#### 7.5 Oscillation circuit

ST7628 is built-in an oscillator circuit. It provides internal clock without external resistor. This oscillator signal is used in the voltage converter and display timing generation circuit.

## 7.6 Display Timing Generator Circuit

This circuit generates some signals to be used for displaying LCD. The display clock, which is generated by oscillation clock, generates the clock for the line counter and the signal for the display data latch. The line address of on-chip RAM is generated in synchronization with the display clock and the display data latch circuit latches the 96-bits display data in synchronization with the display clock. The display data, which is read to the LCD driver, is completely independent of the access to the display data RAM from the microprocessor. The display clock generates an LCD AC signal (M), which enables the LCD driver to make an AC drive waveform, and also generates an internal common timing signal and start signal to the common driver. The frame signal or the line signal changes the M by setting internal instruction. Driving waveform and internal timing signal are shown in Figure 7.5.

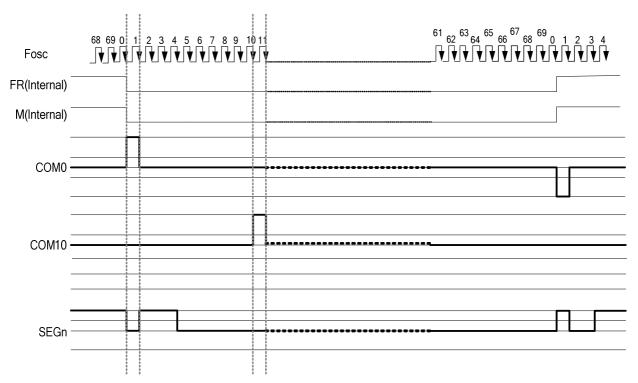

Figure 7.5 2-frame AC Driving Waveform (Duty Ratio: 1/70)

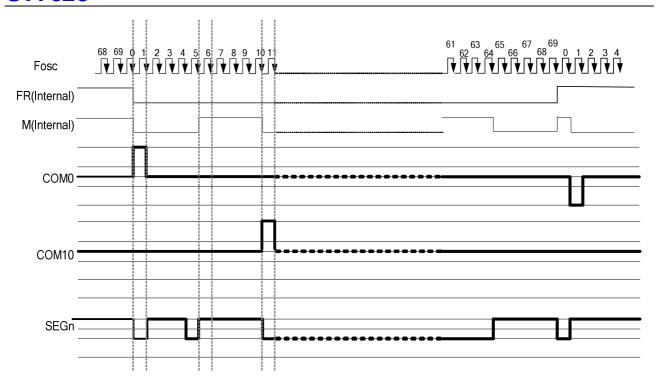

Figure 7.6 N-Line Inversion Driving Waveform (N=5, Duty Ratio=1/70)

#### 7.7 POWER LEVEL DEFINITION

#### 7.7.1 Power ON/OFF SEQUENCE

VDDI and VDDA can be applied in any order. (VDDI=VDD, VDDA=VDD2, VDD3, VDD4, VDD5)

VDDI and VDDA can be powered down in any order.

During power off, if LCD is in the Sleep Out mode, VDDA and VDDI must be powered down minimum 120msec after /RST has been released.

During power off, if LCD is in the Sleep In mode, VDDI or VDDA can be powered down minimum 0msec after /RST has been released.

/CS can be applied at any timing or can be permanently grounded. /RST has priority over /CS.

There will be no damage to the display module if the power sequences are not met.

There will be no abnormal visible effects on the display panel during the Power On/Off Sequences.

There will be no abnormal visible effects on the display between end of Power On Sequence and before receiving Sleep Out command. Also between receiving Sleep In command and Power Off Sequence.

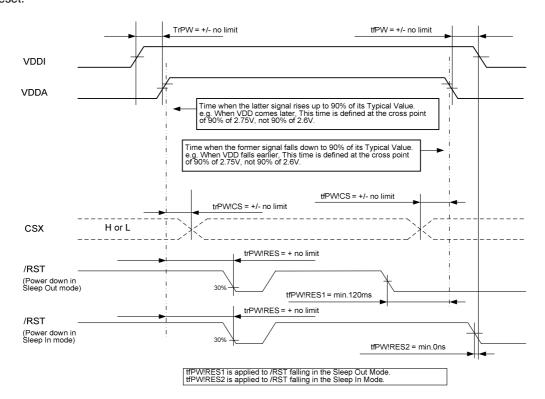

If /RST line is not held stable by host during Power On Sequence as defined in Sections case1 and case2, then it will be necessary to apply a Hardware Reset (/RST) after Host Power On Sequence is complete to ensure correct operation.

Otherwise function is not guaranteed.

The power on/off sequence is illustrated below:

## Case 1 - /RST line is held High or Unstable by Host at Power On

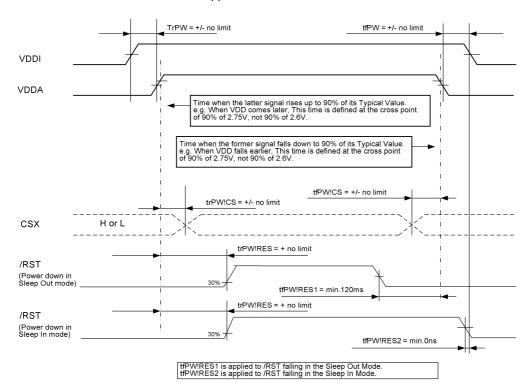

If /RST line is held High or unstable by the host during Power On, then a Hardware Reset must be applied after both VDDA and VDDI have been applied – otherwise correct functionality is not guaranteed. There is no timing restriction upon this hardware reset.

Note: Unless otherwise specified, timings herein show cross point at 50% of signal/power level.

## Case 2 - /RST line is held Low by host at Power On

If /RST line is held Low (and stable) by the host during Power On, then the /RST must be held low for minimum 10µsec after both VDDA and VDDI have been applied.

Note: Unless otherwise specified, timings herein show cross point at 50% of signal/power level.

## **UNCONTROLLED POWER OFF**

The uncontrolled power off means a situation when e.g. there is removed a battery without the controlled power off sequence. There will not be any damages for the display module or the display module will not cause any damages for the host or lines of the interface. At an uncontrolled power off the display will go blank and there will not be any visible effects within 1 second on the display (blank display) and remains blank until "Power On Sequence" powers it up.

#### 7.7.2 Power Levels

6 level modes are defined they are in order of Maximum Power consumption to Minimum Power Consumption:

## 1. Normal Mode On (full display), Idle Mode Off, Sleep Out:

In this mode, the display is able to show maximum 65K colors.

## 2. Partial Mode On, Idle Mode Off, Sleep Out:

In this mode part of the display is used with maximum 65K colors.

#### 3. Normal Mode On (full display), Idle Mode On, Sleep Out:

In this mode, the full display area is used but with 8 colors.

#### 4. Partial Mode On, Idle Mode On, Sleep Out:

In this mode, part of the display is used but with 8 colors.

## 5. Sleep In Mode:

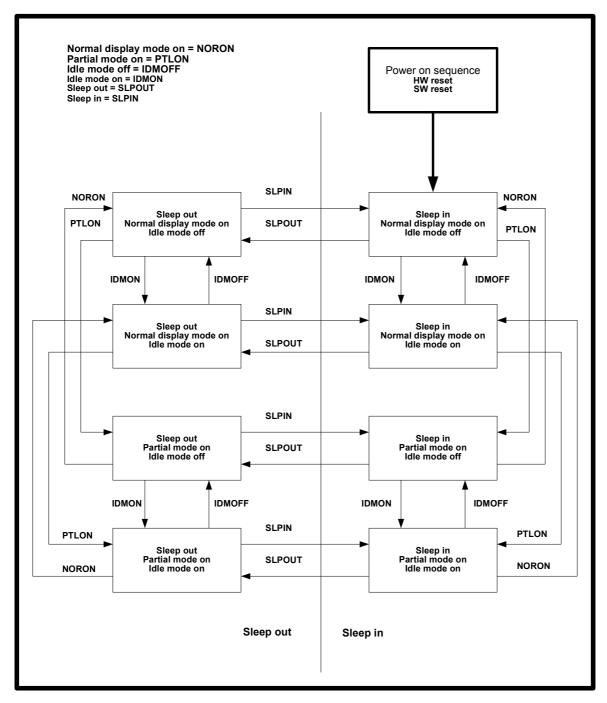

In this mode, the DC:DC converter, Internal oscillator and panel driver circuit are stopped. Only the MCU interface and memory works with Digital VDD power supply. Contents of the memory are safe.

#### 6. Power Off Mode:

In this mode, both Analog VDD and Digital VDD are removed.

Note: Transition between modes 1-5 is controllable by MCU commands. Mode 6 is entered only when both Power supplies are removed.

#### 7.7.3 POWER FLOW CHART FOR DIFFERENT POWER MODES

## Note

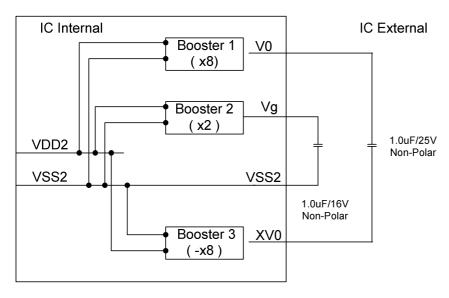

- 1: There is not any abnormal visual effect when there is changing from one power mode to another power mode.
- 2: There is not any limitation, which is not specified by this spec, when there is changing from one power mode to another power mode.

## 7.9 Liquid Crystal Driver Power Circuit

The Power Supply circuits generate the voltage levels necessary to drive liquid crystal driver circuits with low power consumption and the fewest components. There are voltage converter circuits, voltage regulator circuits, and voltage follower circuits. They are controlled by power control instruction.

**DC/DC Booster Block Diagram** 

## 7.9.1 Voltage Regulator Circuits

SET V0 (Temperature = 24°C)

 $V0=a+{Vop[8:0] + VopOffset[8:0] + (EV[6:0]-3Fh)}xb$  (V)

Example:

Vop[8:0]=011010010

VopOffset[8:0]=000000011

EV[6:0]=0111111

V0=3.6 + ( 210 + 3 + (63-63) ) x 0.04 =12.12 (V)

- a is a fixed constant value (seeTable 7.9.1).
- b is a fixed constant value (seeTable 7.9.1).
- Vop [8:0] is the programmed VOP value. The programming range for Vop[8:0] is 5 to 410 (19Ahex).
- The range of contrast is 128 steps for fine tuning VOP.

**Table 7.9.1** 

SYMBOL	VALUE	UNIT
а	3.6	V
b	0.04	V

The Vop [8:0] value must be in the V0 programming range as given in Figure 7.7. Evaluating V0 equation, values outside the programming range indicated in many result.

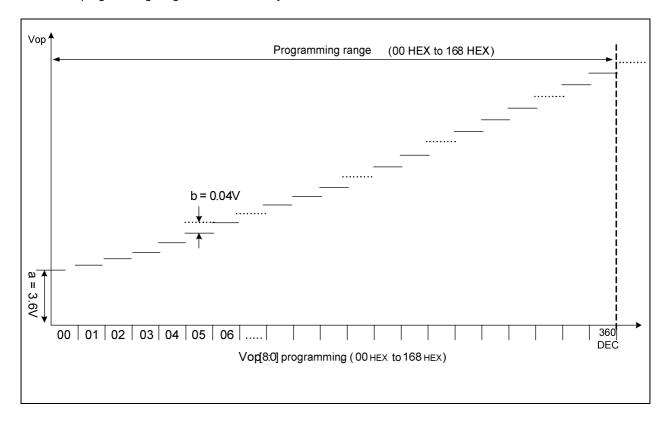

Figure 7.7 V0 programming range

As the programming range for the internally generated V0 voltage is above the limited V0 (18V), users has to ensure while setting the VOP register and selecting the temperature compensation that under all conditions and including all tolerances that the V0 voltage remains below 18V.

## SET V0 with temperature compensation (Temperatue ≠ 24°C)

There are 16-line slope in each temperature steps and customer can select one line slope of temperature compensation coefficiency for each temperature step. Each temperature step is 8°C. Please see Figure 7.8 as below.

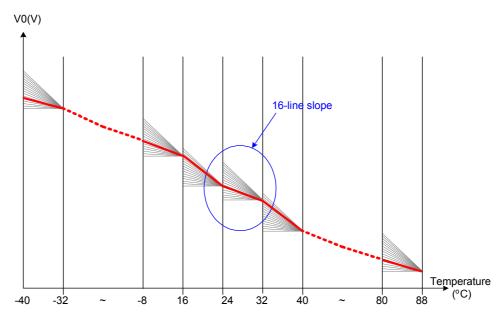

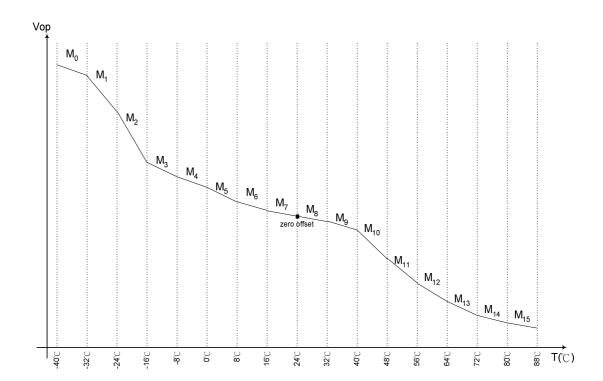

Figure 7.8

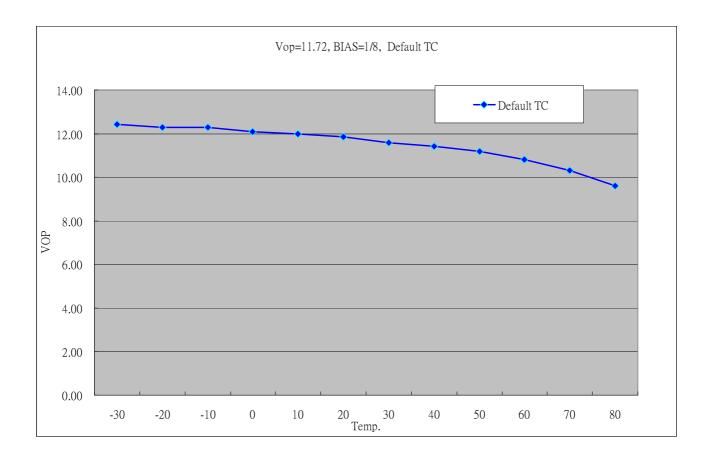

In command TEMPSEL (see section 9.1.72) each MTx, where x=0, 1, 2,..., E, F, has a value between 0 and 15. MTx = 0 results in 0V increment on V0, MTx = 1 results in Mx=5mV increment, ..., MTx = 15 results in Mx=15x5mV=75mV increment. Note that each MTx individually corresponds to a temperature interval; The relations between Mx and V0 quantity due to temperature V0(T) are described in the equations shown as follows:

Temperature range	Equation V0(V) at temperature=T℃
-40°C ≦ T < -32°C	$V0(T) = V0(T_{24}) + (-32-T) \cdot M0 + (M1 + M2 + M3 + M4 + M5 + M6 + M7) \cdot 8$
-32°C ≤ T < -24°C	$V0(T) = V0(T_{24}) + (-24-T) \cdot M1 + (M2 + M3 + M4 + M5 + M6 + M7) \cdot 8$
-24°C ≤ T < -16°C	$V0(T) = V0(T_{24}) + (-16-T) \cdot M2 + (M3 + M4 + M5 + M6 + M7) \cdot 8$
-16°C ≦ T < -8°C	$V0(T) = V0(T_{24}) + (-8-T) \cdot M3 + (M4 + M5 + M6 + M7) \cdot 8$
-8°C ≤ T < 0°C	$V0(T) = V0(T_{24}) + (0-T) \cdot M4 + (M5 + M6 + M7) \cdot 8$
0°C ≦ T < 8°C	$V0(T) = V0(T_{24}) + (8-T) \cdot M5 + (M6 + M7) \cdot 8$
8°C ≤ T < 16°C	$V0(T) = V0(T_{24}) + (16-T) \cdot M6 + M7 \cdot 8$
16°C ≤ T < 24°C	$V0(T) = V0(T_{24}) + (24-T) \cdot M7$
24°C ≦ T < 32°C	$V0(T) = V0(T_{24}) - (T-24) \cdot M8$
32°C ≤ T < 40°C	$V0(T) = V0(T_{24}) - (T-32) \cdot M9 - M8 \cdot 8$
40°C ≤ T < 48°C	$V0(T) = V0(T_{24}) - (T-40) \cdot M10 - (M9 + M8) \cdot 8$
48°C ≤ T < 56°C	$V0(T) = V0(T_{24}) - (T-48) \cdot M11 - (M10 + M9 + M8) \cdot 8$
56°C ≤ T < 64°C	$V0(T) = V0(T_{24}) - (T-56) \cdot M12 - (M11 + M10 + M9 + M8) \cdot 8$
64°C ≤ T < 72°C	$V0(T) = V0(T_{24}) - (T-64) \cdot M13 - (M12 + M11 + M10 + M9 + M8) \cdot 8$
<b>72</b> °C ≤ T < 80°C	$V0(T) = V0(T_{24}) - (T-72) \cdot M14 - (M13 + M12 + M11 + M10 + M9 + M8) \cdot 8$
80°C ≤ T < 88°C	$V0(T) = V0(T_{24}) - (T-80) \cdot M15 - (M14 + M13 + M12 + M11 + M10 + M9 + M8) \cdot 8$

#### V0 fine tuning

ST7628 has 2 commands for fine tuning V0. These commands are VopOfsetInc (see section 9.1.48) and VopOfsetDec (see section 9.1.49). When writing VopOfsetInc into IC for each time, V0 would increase 40mV; when writing VopOfsetDec into IC for each time, V0 would decrease 40mV.

Example:

Vop[8:0]=011010010

Vopoffset[8:0]=000000011

EV[6:0]=0111111

VopOfsetInc x2

 $\rightarrow$  V0=3.6 +( 210 +3+ (63-63) +2 } x 0.04 =12.2 (V)

## 7.9.2 Voltage Follower Circuits

There is a built-in voltage follower circuits in ST7628 for generating Vg and Vm. These voltages are decided by bias ratio selection circuitry which is set by users with software to control 1/5 to 1/12 bias ratios to match the optimum display performance of LCD panel. Bias driving rule is listed below:

LCD bias	Vg	Vm		
1/N bias	(2/N) x V0	(1/N) x V0		

N=5 to 12

## 7.9.3 OTP Setting Flow

**OTP Setting Flow** 

ST7628 provide the Write and Read function to write the Electronic Control value and Built-in resistance ratio into and read them from the built-in OTP. Using the Write and Read functions, you can store these values appropriate to each LCD panel. This function is very convenient for user in setting from some different panel's voltage. But using this function must attention the setting procedure. Please see the following diagram.

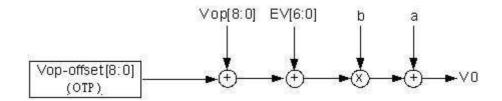

Figure 7.9 V0 value control for different modules by loading OTP offset

Note1: This setting flow is used for LCM assembler.

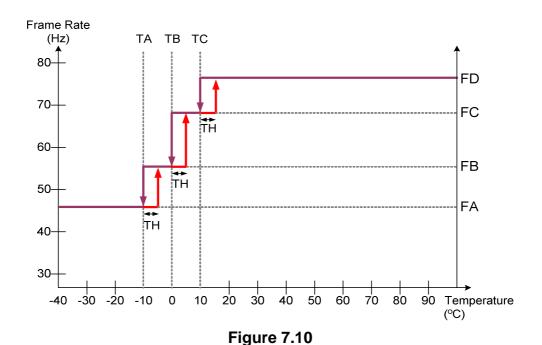

Note2: OTP shouldn't be written without preceding loading correctly from OTP to avoid some errors during IC operation.

Note3: When writing value to OTP, the voltage of VPP must be more than 7.5V(7.5V $\sim$ 7.75V); the current of lvpp must be more than 4 mA. Note4: If the OTP is exposed to a high temperature for hours, data in the memory cell may probably be lost before the data retention guarantee period. To retain data in the memory cell, keep the memory cell below 90 $^{\circ}$ C. The data retention guarantee period is specified including the retention period.

## 7.9.4 Frquency Temperature Gradient Compensation Coefficient

ST7628 will auto-switch frame rate on different temperature such as Figure 11.1. TA, TB and TC are frame rate switching temperatures which can be defined by customer with command TMPRNG(see section 9.1.70). FA, FB, FC and FD are switched frame rate which also can be defined by customer with command FRMSEL (see section 9.1.68). The frame rate range is from 37.5Hz to 170Hz.

When the temperature is in increasing state, frame rate changes to the higher step at TA/TB/TC+TH( $^{\circ}$ C). When the temperature is in decreasing state, frame rate changes to the lower step at TA/TB/TC. For example: TC=10 $^{\circ}$ C and TH=5 $^{\circ}$ C, FC switches to FD at 15 $^{\circ}$ C but FD switches to FC at 10 $^{\circ}$ C. Please take Figure 11.1for reference.

#### Note:

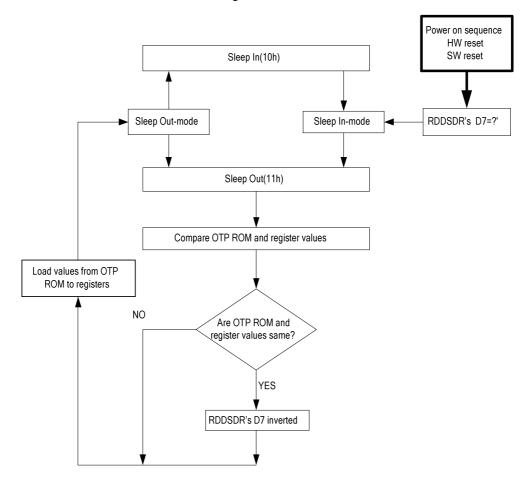

Please make sure to avoid any kind of heating source closing to ST7628 such as back light, to prevent Vop is not anticipatve because of temperature compensate circuit worked.

# 7.10 Sleep Out –Command and Self-Diagnostic Functions of the Display Module 7.10.1 Register loading Detection

Sleep Out-command is a trigger for an internal function of the display module, which indicates, if the display module loading function of factory default values from OTP ROM (or similar device) to registers of the display controller is working properly.

There are compared factory values of the OTP ROM and register values of the display controller by the display controller (1st step: compares register and OTP ROM values, 2nd step: loads OTP ROM values to registers). If those both values (OTP ROM and register values) are same, there is inverted (= increased by 1) a bit, which is defined in command RDDSDR) (The used bit of this command is D7). If those both values are not same, this bit (D7) is not inverted (= not increased by 1).

The flow chart for this internal function is following:

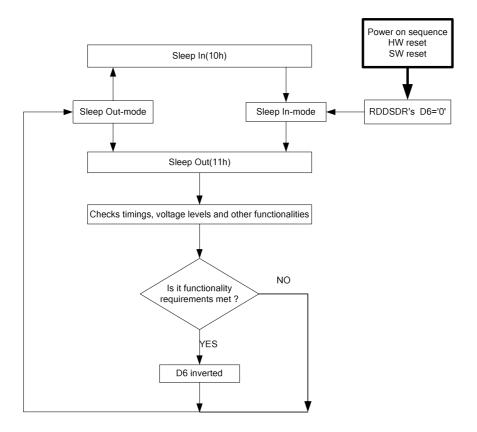

## 7.10.2 Functionality Detection

Sleep Out-command is a trigger for an internal function of the display module.

The internal function (= the display controller) is comparing if the display module is still meeting functionality requirements (e.g. booster voltage levels, timings, etc.). If functionality requirement is met, there is inverted (= increased by 1) a bit, which defined in command Read Display Self-Diagnostic Result (0Fh)" (= RDDSDR) (The used bit of this command is D6). If functionality requirement is not same, this bit (D6) is not inverted (= not increased by 1).

The flow chart for this internal function is following:

Note: There is needed 120msec after Sleep Out -command, when there is changing from Sleep In -mode to

Sleep Out -mode, before there is possible to check if functionality requirements are met and a value of RDDSDR's D6 is valid. Otherwise,

there is 5msec delay for D6's value, when Sleep Out -command is sent in Sleep Out -mode.

Note 1: When /EXT connects to H or floating, commands which are not defined in "Command Table-1" are treated as NOP (00H) command.

Note 2: Commands 10H, 12H, 13H, 20H, 21H, 25H, 28H, 29H, 30H, 36H (Bit ML only), 38H and 39H are updated during V-sync when Module is in Sleep Out Mode to avoid abnormal visual effects.

During Sleep In mode, these commands are updated immediately.

Read status (09H), Read Display Power Mode (0AH), Read Display MADCTR (0BH), Read Display Pixel Format (0CH), Read Display Image Mode (0DH), Read Display Signal Mode (0EH) and Read Display Self Diagnostic Result (0FH) of these commands is updated immediately both in Sleep In mode and Sleep Out mode.

3rd parameter	1	1	0	-	BFA6	BFA5	BFA4	BFA3	BFA2	BFA1	BFA0	-

#### NOTE: "-" Don't care

## Descriptio n

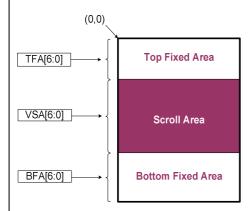

This command just defines the Vertical Scrolling Area of the display and not performs vertical scroll. When MADCTR BL=0

The 1<sub>st</sub> parameter TFA [6:0] describes the Top Fixed Area (in No. of lines from Top of the Frame Memory and Display).

The 2nd parameter VSA [6:0] describes the height of the Vertical Scrolling Area (in No. of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address) The first line appears immediately after the bottom most line of the Top Fixed Area.

The 3rd parameter BFA [6:0] describes the Bottom Fixed Area (in No. of lines from Bottom of the Frame Memory and Display).

TFA, VSA and BFA refer to the Frame Memory Line Pointer.

#### Restriction

The condition is (TFA+VSA+BFA) = 70, otherwise Scrolling mode is undefined.

In Vertical Scroll Mode, MADCTR parameter MV should be set to '0'-this only affects the Frame Memory Write.

TFA[6:0], VSA[6:0] and BFA[6:0] is based on line unit.

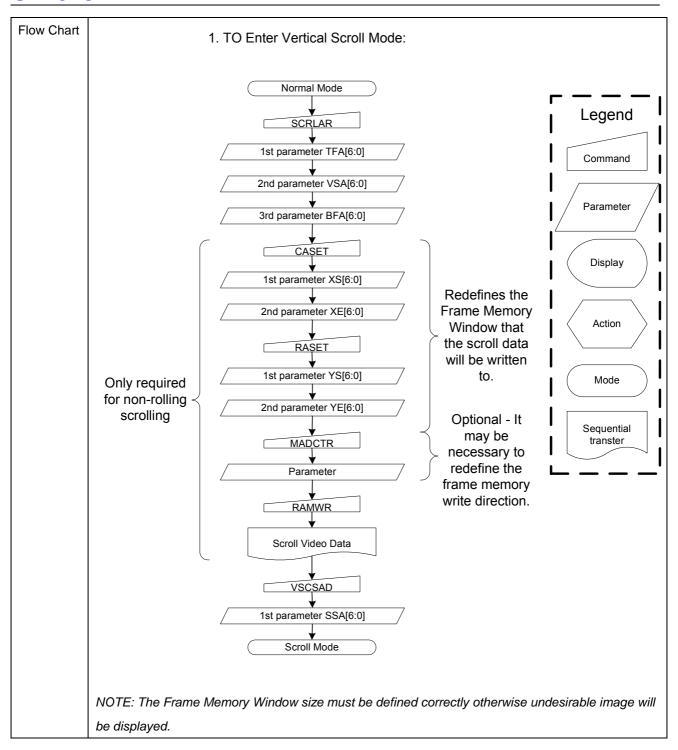

TFA[6:0]= 00h, 01h, 02h, 03h, ..., 46h

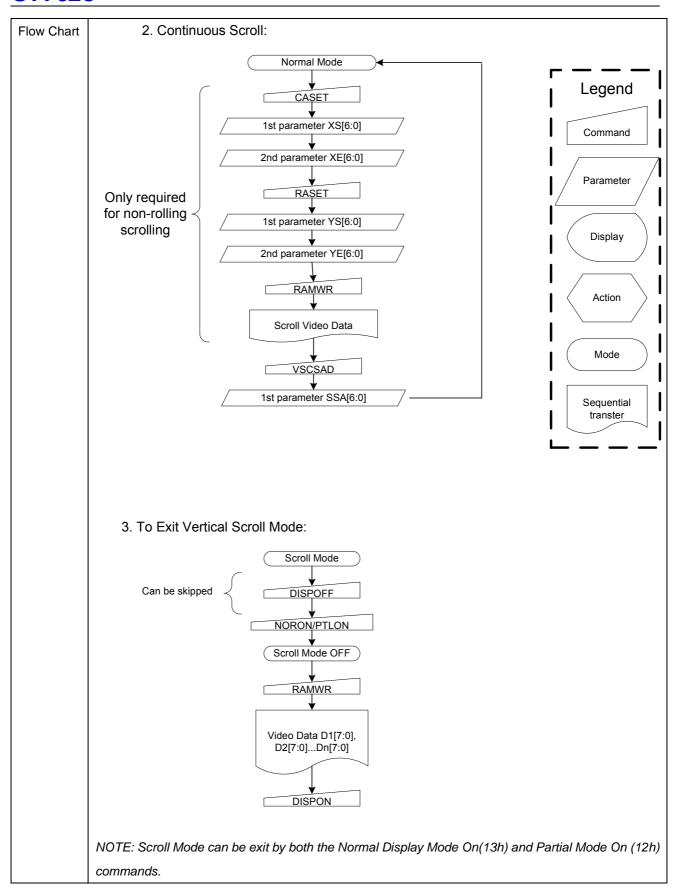

VSA[6:0] = 00h, 01h, 02h, 03h, ..., 46h

BFA[6:0]= 00h, 01h, 02h, 03h, ..., 46h

Parameter	1	1	0	MY	MX	MV	ML	RGB	-	-	-	-

#### NOTE: "-" Don't care

#### Description

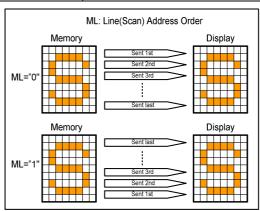

This command defines read/write scanning direction of frame memory.

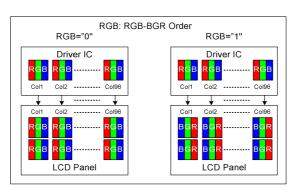

This command makes no change on the other driver status.

Note: ML affects to Partial Area (30h), Vertical Scrolling Definition (33h), Vertical Scrolling Start address (37h), Partial On (12h) commands

### Bit Assignment

Bit	NAME	DESCRIPTION
MY	ROW ADDRESS ORDER	These 3bits controls MCU to memory write/read direction.
MX	COLUMN ADDRESS ORDER	(See Section 7.3.2 "MCU to memory write/read direction")
MV	ROW/COLUMN ORDER	
ML	LINE ADDRESS ORDER	LCD refresh direction control
RGB	RGB-BGR ORDER	Color selector switch control
		0=RGB color filter panel, 1=BGR color filter panel)
		The contents of the frame memory are not changed.

Restriction	D2, D1 and D0 of the 1st parameter are set to '00	00'internally.

#### 9.1.32 VSCSAD: Vertical Scroll Start Address of RAM (37h)

Command	A0	/RD	/WR	D7	D6	D5	D4	D3	D2	D1	D0	Hex
VSCSAD	0	1	0	0	0	1	1	0	1	1	1	(37h)
Parameter	1	1	0	-	SSA6	SSA5	SSA4	SSA3	SSA2	SSA1	SSA0	

NOTE: "-" Don't care

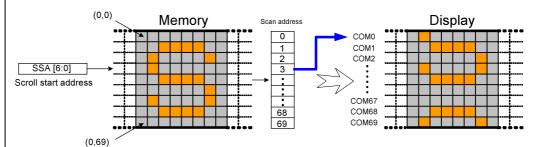

#### Description

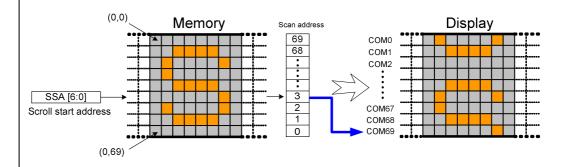

This command is used together with Vertical Scrolling Definition (33h). These two commands describe the scrolling area and the scrolling mode.

The Vertical Scrolling Start Address command has one parameter which describes which line in the Frame Memory will be written as the first line after the last line of the Top Fixed Area on the display as illustrated below:

This command Start the scrolling.

Exit from V-scrolling mode by commands Partial mode On (12h) or Normal mode On (13h).

NOTE: When new Pointer position and Picture Data are sent, the result on the display will happen at the next Panel Scan to avoid tearing effect.

SSA refers to the Frame Memory line Pointer

#### Restriction

Since the value of the Vertical Scrolling Start Address is absolute (with reference to the Frame Memory), it must not enter the fixed area (defined by Vertical Scrolling Definition (33h)-otherwise undesirable image will be displayed on the Panel.

SSA [6:0] is based on line unit.

SSA [6:0] = 00h, 01h, 02h, 03h, ..., 45h

#### NOTE:

- \*1) Applies to IF1, IF2, IF3, /CS, /RST, /WR, /RD, A0(SCL) and D15-D2, D1 (A0) ,D0(SI) pins
- \*2) \*3) When the measurements are performed with LCD module, Measurement Points are like below.

### 10.2.2 Current Consumption (Bare die)

		Current consumption			
Operation mode	Condition	Typical	Maximum		
		IDD (mA)	IDD (mA)		
	1. 1/2 gray pattern				
	2. Vddi=1.8V, Vdda=2.8V	0.45	0.68		
- Normal Mode	3. Vop=12V, bias=1/8, N=0x01, FR=77Hz,				
	x8 booster, Ta=25°ℂ				
- Sleep In Mode	Vddi=1.8V, Vdda=2.8V, Ta=25°C	0.01	0.015		

#### NOTE:

The Current Consumption is DC characteristics of ST7628.

.

## 11. TIMING CHARACTERISTICS

## 11.1 Parallel Interface Characteristics bus (8080-series MCU)

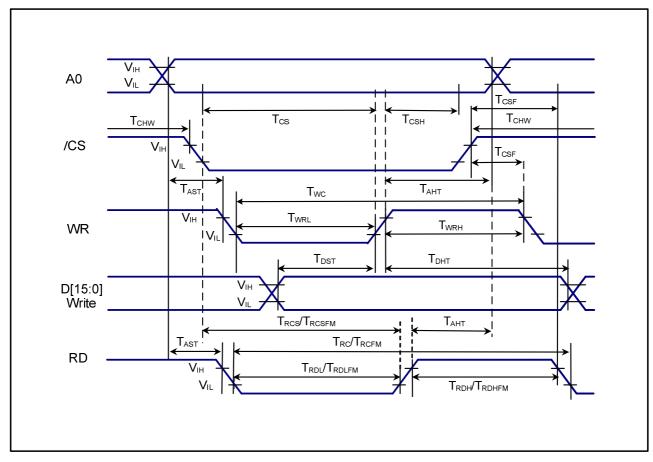

Figure 11.1 Parallel Interface Characteristics bus(8080-series MCU)

(VSS=0V, VDDI=1.65V to 3.0V, VDDA=2.4V to 3.3V, Ta =25°C)

Signal	Symbol	Parameter		MAX	Unit	Description
A0	$T_{AST}$	Address setup time	15	-	ns	
AU	$T_{AHT}$	Address hold time (Write/Read)	15	-	ns	-
	$T_{CHW}$	Chip select "H" pulse width	0	-	ns	
	$T_{CS}$	Chip select setup time (Write)	40	-	ns	
/CS	$T_{RCS}$	Chip select setup time (Read ID)	100	-	ns	
	$T_{RCSFM}$	Chip select setup time (Read FM)	355	-	ns	
	$T_{CSF}$	Chip select wait time (Write/Read)	15	-	ns	
	$T_{WC}$	Write cycle	250	-	ns	
WR	$T_{WRH}$	T <sub>WRH</sub> Control pulse "H" duration		-	ns	
	$T_{WRL}$	Control pulse "L" duration	60	-	ns	
	$T_{RC}$	Read cycle (ID)	250	-	ns	
RD (ID)	$T_{RDH}$	Control pulse "H" duration (ID)		-	ns	When read ID data
	$T_{RDL}$	Control pulse "L" duration (ID)	150	-	ns	
	$T_{RCFM}$	Read cycle (FM)	550	-	ns	When read from frame
RD (FM)	T <sub>RDHFM</sub> Control pulse "H" duration (FM)		355	-	ns

	$T_{RDLFM}$	Control pulse "L" duration (FM)	355	-	ns	memory
D[15:0]	$T_{DST}$	Data setup time	50	-	ns	
D[15:0]	$T_{\mathrm{DHT}}$	Data hold time	15	-	ns	

## 11.3 Serial Interface Characteristics (3-pin Serial)

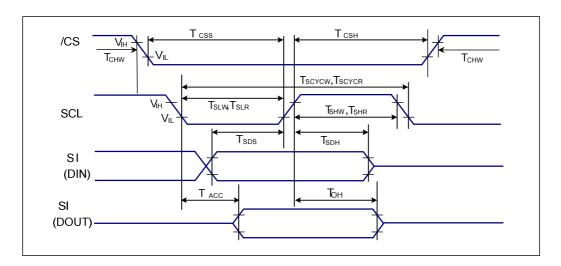

Figure 11.6 3-pin Serial Interface Characteristics

(VSS=0V, VDDI=1.65V to 3.0V, VDDA=2.4V to 3.3V,Ta =25°C)

Signal	Symbol	Parameter	MIN	MAX	Unit	Description
	$T_{CHW}$	/CS "H" pulse width	45		ns	
/CS	$T_{CSS}$	/CS-SCL setup time(Write)	60		ns	
/C3	$T_{CSH}$	/CS-SCL hold time(Write)	65		ns	
	$T_{SCC}$	Chip select setup time	20		ns	
	$T_{SCYCW}$	Serial clock cycle (Write)	100		ns	
	$T_{SHW}$	SCL "H" pulse width (Write)	35		ns	
SCL	$T_{SLW}$	SCL "L" pulse width (Write)	35		ns	
SCL	$T_{SCYCR}$	Serial clock cycle (Read)	150		ns	
	$T_{SHR}$	SCL "H" pulse width (Read)	60		ns	
	$T_{SLR}$	SCL "L" pulse width (Read)	60		ns	
CI	$T_{SDS}$	Data setup time	60		ns	
SI (DIN)	$T_{SDH}$	Data hold time	60		ns	
(DOUT)	$T_{ACC}$	Access time	10	100	ns	For maximum CL=30pF
(2001)	T <sub>OH</sub>	Output disable time	15	50	ns	For minimum CL=8pF

## 11.4 Serial Interface Characteristics (4-pin Serial)

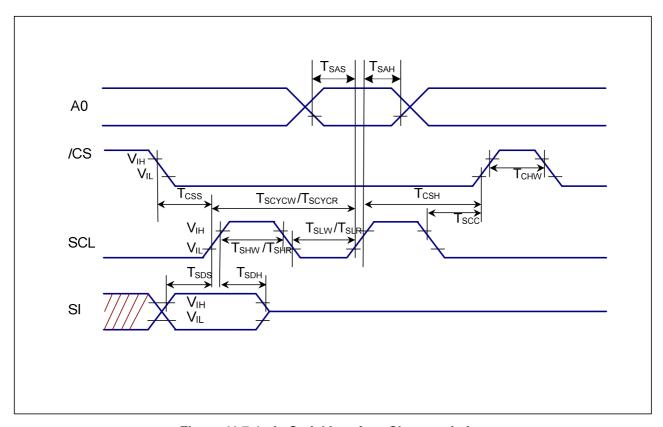

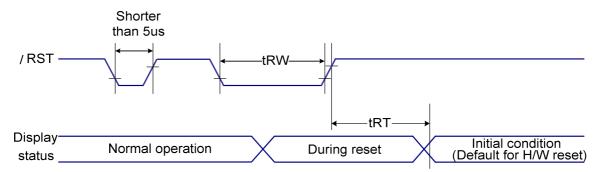

Figure 11.7 4-pin Serial Interface Characteristics

(VSS=0V, VDDI=1.65V to 3.0V, VDDA=2.4V to 3.3V, Ta =25 $^{\circ}$ C)

Signal	Symbol	Parameter	MIN	MAX	Unit	Description
	$T_{CSS}$	Chip select setup time	60		ns	
/CS	$T_{CSH}$	Chip select hold time	65		ns	
/C5	$T_{SCC}$	Chip select setup time	20		ns	
	$T_{CHW}$	Chip select setup time	45		ns	
A0	$T_{SAS}$	Address setup time	30		ns	
AU	$T_{SAH}$	Address hold time	30		ns	
	$T_{SCYCW}$	Serial clock cycle (Write)	100		ns	
	$T_{SHW}$	SCL "H" pulse width (Write)	35		ns	
SCL	$T_{SLW}$	SCL "L" pulse width (Write)	35		ns	
SCL	$T_{SCYCR}$	Serial clock cycle (Read)	150		ns	
	$T_{SHR}$	SCL "H" pulse width (Read)	60		ns	
	$T_{SLR}$	SCL "L" pulse width (Read)	60		ns	
SI	$T_{SDS}$	Data setup time	60		ns	
31	$T_{SDH}$	Data hold time	60		ns	

### 12. RESET TIMING

(VSS=0V, VDDI=1.65V to 3.0V, VDDA=2.4V to 3.3V,Ta =25℃)

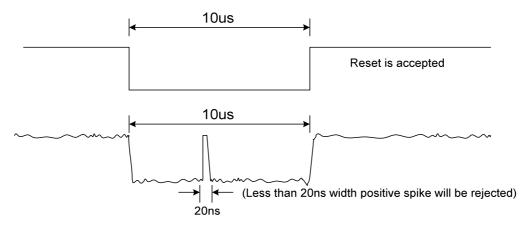

Item	Cianal	Crombal	Condition		Units	
	Signal	Symbol	Condition	Min.	Max.	Units
Reset "L" pulse width	/RST	tRW		10	_	us
					5	
Description -		4DT		_	(*note 5)	ms
Reset time		tRT			120	
				_	(*note 6,7)	ms ms

#### Notes:

- 1. The reset cancel includes also required time for loading ID bytes, VCOM setting and other settings from EEPROM (or similar device) to registers. This loading is done every time when there is HW reset cancel time (tRT) within 5 ms after a rising edge of RST
- 2. Spike due to an electrostatic discharge on RST line does not cause irregular system reset according to the table below:

RST Pulse	Action
Shorter than 5µs	Reset Rejected
Longer than 9µs	Reset
Between 5µs and 9µs	Reset starts

- 3. During the Resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Sleep Out –mode. The display remains the blank state in Sleep In -mode.) and then return to Default condition for Hardware Reset.
- 4. Spike Rejection also applies during a valid reset pulse as shown below:

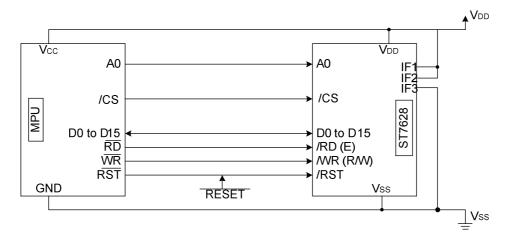

- 5. When Reset applied during Sleep In Mode.
- 6. When Reset applied during Sleep Out Mode.
- 7. It is necessary to wait 5msec after releasing RST before sending commands. Also Sleep Out command cannot be sent for 120msec.

## 13. THE MPU INTERFACE (REFERENCE EXAMPLES)

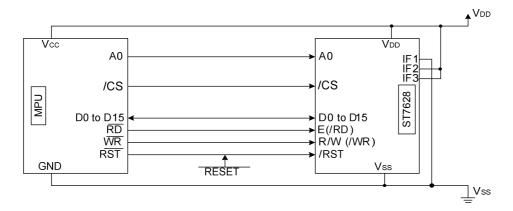

The ST7628 Series can be connected to either 8080 Series MPUs or to 6800 Series MPUs. Moreover, using the serial interface it is possible to operate the ST7628 series chips with fewer signal lines.

The display area can be enlarged by using multiple ST7628 Series chips. When this is done, the chip select signal can be used to select the individual ICs to access.

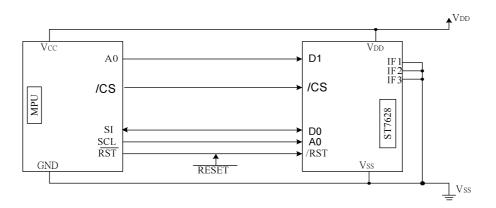

#### (1) 8080 Series MPUs

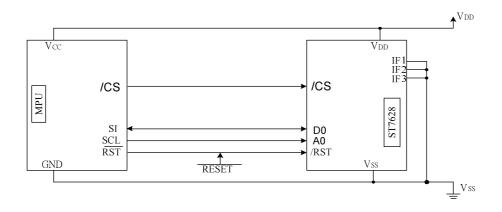

#### (2) 6800 Series MPUs

#### (3) Using the Serial Interface (4-line interface)

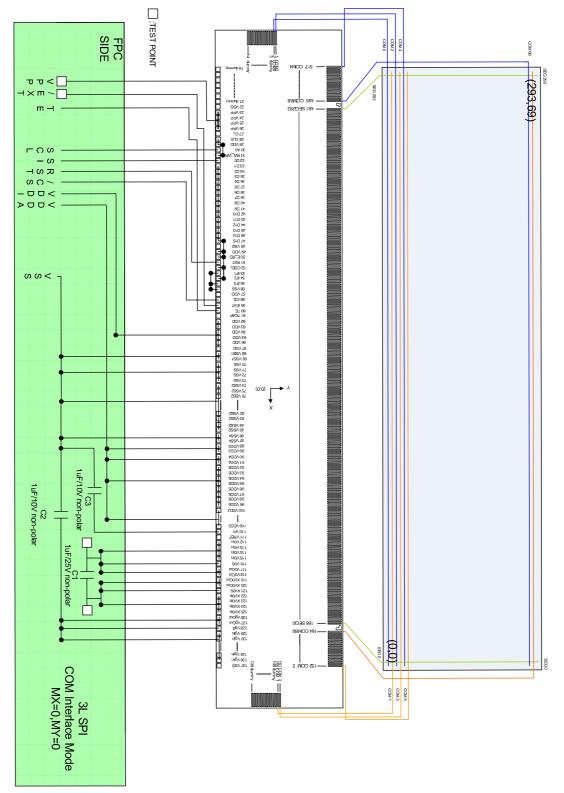

## (4) Using the Serial Interface (3-line interface)

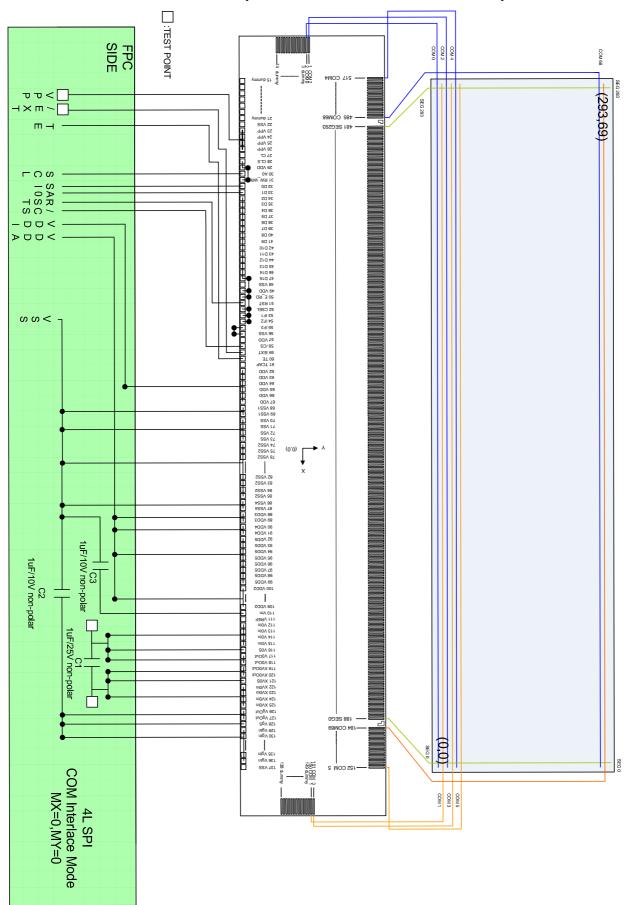

## A - Application Note

## ◆ A1 – Reference Circuit (3L SPI / COM interlace Mode)

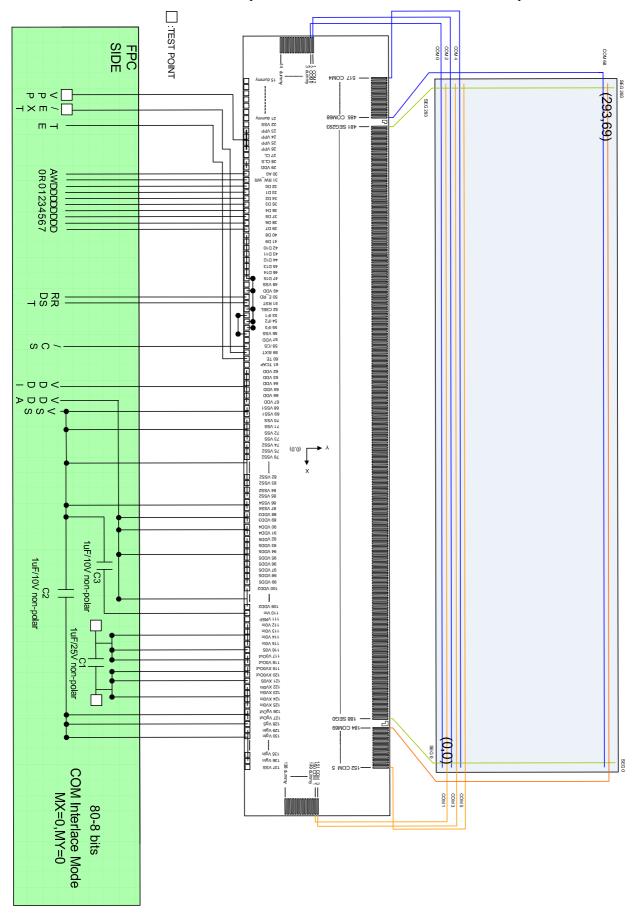

Note1: If VDDI and VDDA need capacitosr toVSS for ripple avoidance, the suggestion type should be 1uf/5V non-polar. Note2: All of the microprocessor interface pin should not be floating on any operations.

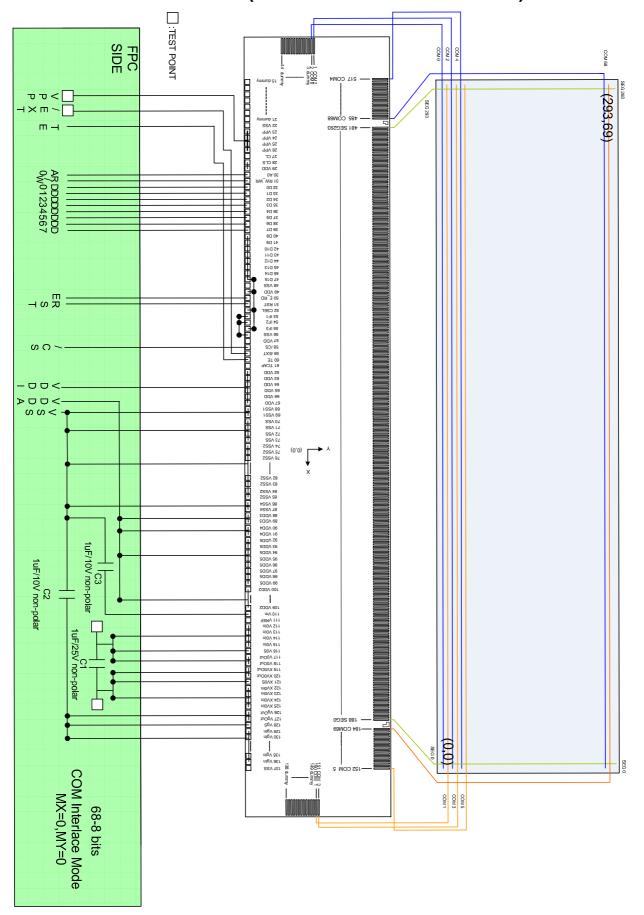

## ◆ A1 - Reference Circuit (4L SPI / COM interlace Mode)

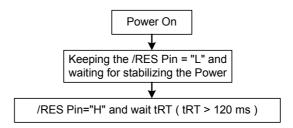

## ◆ A1 - Reference Circuit (80-8bits / COM interlace Mode)

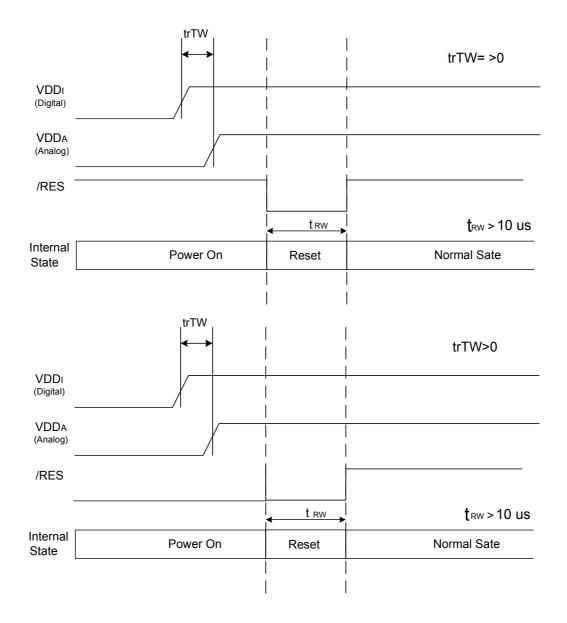

## ◆ A1 – Reference Circuit (68-8bits / COM interlace Mode)

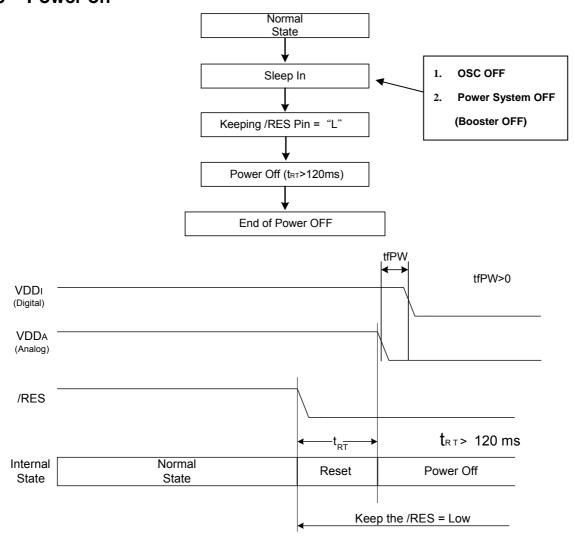

## ♦ A2 – Power On

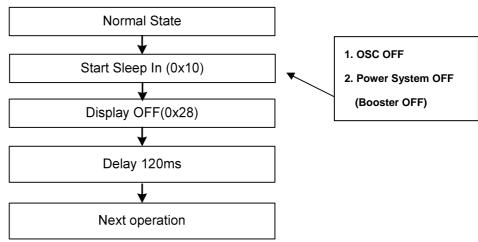

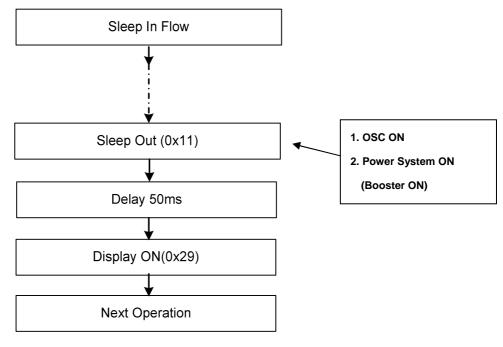

## ♦ A3 – Power off

## ♦ A4 – Sleep In Flow

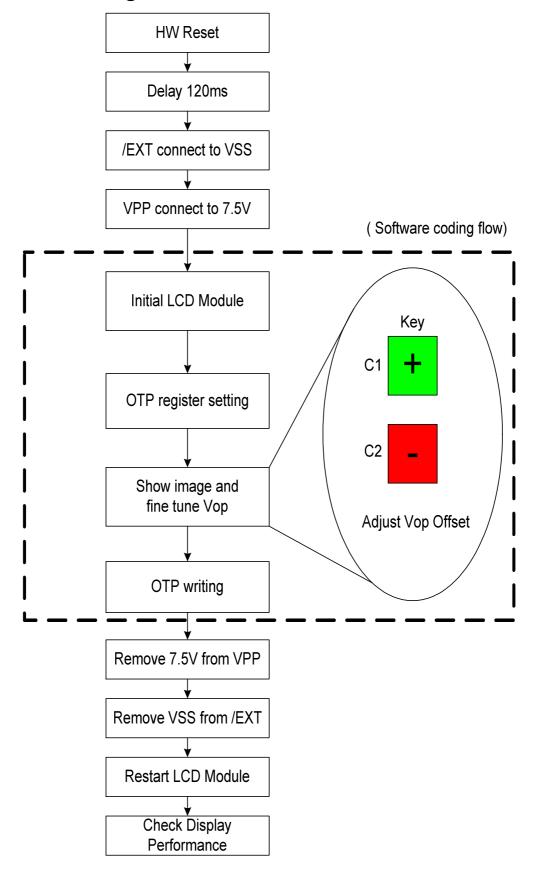

## ♦ A5 – Sleep Out Flow

2008/08

## ♦ A6 – OTP Burning Flow:

# ♦ A7 – Software coding flow
