Table of Contents

1	Introduction
	1.1 Scope
	1.2 Overview Description
2	Features
	2.1 Integrated Frame Buffer
	2.2 CPU Interface
	2.3 Input Data Formats
	2.4 Display Support
	2.5 Display Modes
	2.6 Display Features
	2.7 Clock Source
	2.8 Miscellaneous
3	Block Diagram
4	Pins
	4.1 Pinout Diagrams
	4.2 Pin Descriptions
	4.2.1 Intel 80 Host Interface
	4.2.2 LCD Interface
	4.2.3 Clocks
	4.2.4 Miscellaneous
	4.2.5 Power And Ground
	4.3 Summary of Configuration Options
5	Pin Mapping
	5.1 Intel 80 Data Pins
	5.2 LCD Interface Data Pins
6	D.C. Characteristics
	6.1 Absolute Maximum Ratings
	6.2 Recommended Operating Conditions
	6.3 Electrical Characteristics
7	A.C. Characteristics
	7.1 Clock Timing
	7.1.1 Input Clocks
	7.1.2 PLL Clock
	7.2 RESET# Timing
	7.3 Host interface Timing
	7.3.1 Intel 80 Interface Timing - 1.8 Volt

7.3.3 Definition of Transition Time to Hi-Z State 7.4 Display Interface 3.7.4.1 TFT Power-On Sequence 7.4.2 TFT Power-Off Sequence 3.7.4.3 Generic 18/24-Bit TFT Panel Timing 3.8 Memory 3.7.4.3 Generic 18/24-Bit TFT Panel Timing 3.8 Memory 3.9 Clocks 3.9.1 Clock Descriptions 3.9.2 PLL Block Diagram 4.9.3 Clocks versus Functions 4.9.3 Clocks versus Functions 4.0 Setting SYSCLK and PCLK 4.10 Register 4.10.1 Register Mapping 4.10.2 Register Mapping 4.10.3 Register Descriptions 4.10.3.1 Read-Only Configuration Registers 4.10.3.2 Clock Configuration Registers 4.10.3.3 Panel Configuration Registers 4.10.3.4 Input Mode Registers 5.10.3.5 Display Mode Registers 5.10.3.6 Window Settings 6.10.3.7 Memory Access 10.3.8 Gamma Correction Registers 6.10.3.9 Miscellaneous Registers 6.10.3.10 General Purpose IO Pins Registers 6.10.3.10 General Purpose IO Pins Registers 6.10.3.10 General Purpose IO Pins Registers 7.13.1 16 bpp Mode (R 5-bit, G 6-bit, B 5-bit), 65,536 colors 7.13.2 18 bpp (R 6-bit, G 6-bit, B 8-bit), 16,777,216 colors 7.14.1 16 bpp (R 5-bit, G 6-bit, B 8-bit), 16,777,216 colors 7.14.1 18 bpp Mode 1 (R 6-bit, G 8-bit, B 8-bit), 16,777,216 colors 7.14.5 24 bpp Mode 2 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors 7.14.5 24 bpp Mode 2 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors 7.14.5 24 bpp Mode 2 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors 7.14.5 24 bpp Mode 2 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors 7.14.5 24 bpp Mode 2 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors 7.14.5 24 bpp Mode 2 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors 7.14.5 24 bpp Mode 2 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors 7.14.5 24 bpp Mode 2 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors 7.15.5 24 bpp Mode 2 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors 7.16.5 24 bpp Mode 2 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors 7.16.5 24 bpp Mode 2 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors 7.17.5 24 bpp Mode 2 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors 7.18.5 24 bpp Mode 2 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors		7.3.2 Intel 80 Interface Timing - 3.3 Volt	29

1 Introduction

1.1 Scope

This is the Hardware Functional Specification for the S1D13743 Embedded Memory LCD Controller. Included in this document are timing diagrams, AC and DC characteristics, register descriptions, and power management descriptions. This document is intended for two audiences: Video Subsystem Designers and Software Developers.

This document is updated as appropriate. Please check the Epson Research and Development Website at **www.erd.epson.com** for the latest revision of this document before beginning any development.

We appreciate your comments on our documentation. Please contact us via email at documentation@erd.epson.com.

1.2 Overview Description

The S1D13743 is a color mobile graphics engine with an embedded 464K byte display buffer. The S1D13743 supports a 8/16-bit Intel 80 CPU architecture while providing high performance bandwidth into 24 bpp display memory allowing for fast screen updates.

Products requiring a rotated display image can take advantage of the SwivelViewTM feature which provides hardware rotation of the display memory transparent to the software application. Resolutions supported include 352x440 @ 24 bpp single buffered or 320x240 @ 24 bpp double-buffered. The S1D13743 uses a double-buffer architecture to prevent any visual tearing during streaming video screen updates.

2 Features

2.1 Integrated Frame Buffer

• Embedded 464K byte SRAM display buffer

2.2 CPU Interface

- 8/16-bit Intel 80 interface (used for display or register data)
- Chip select is used to select device. When inactive, any input data/command is ignored.

2.3 Input Data Formats

• RGB: 8:8:8, 6:6:6, 5:6:5

Note

All input data is converted and stored as RGB 8:8:8 (see Section 12, "RGB Input Data Conversion" on page 72 for further information)

• YUV: 4:2:2, 4:2:0 (Internal YUV to RGB Converter converts and stores data as 24 bpp)

2.4 Display Support

- Active Matrix TFT interface
 - 18/24-bit interface
 - Frame Rate Modulation using 24 bpp data when configured for an 18-bit LCD panel.

2.5 Display Modes

• 24 bit-per-pixel (bpp) color depth

Note

All data is stored as 24 bpp. 18-bit panels are supported using the 18 msb's when FRM is disabled or all 24 bits when FRM is enabled.

2.6 Display Features

- All display writes are handled by window apertures/position for complete or partial display updates. All window coordinates are referenced from the top left corner of the displayed image. Even for a rotated display, the top-left corner is maintained and no translation needs to take place.
- SwivelViewTM: 90°, 180°, 270° counter-clockwise hardware rotation of the display image. All displayed windows can have independent rotation. No additional programming necessary when enabling these modes.
- Double-Buffering is available to prevent image tearing during streaming input. To be supported, resolutions must fit within 228K bytes (½ of the available display buffer). A typical resolution is 320x240 @ 24 bpp.
- Pixel Doubling uses horizontal and vertical averaging to achieve smooth doubling of a single window. Pixel doubling may be applied to only a single window at any one time.
- Pixel Halving: no limitation on number of windows.

2.7 Clock Source

- Internal programmable PLL
- Single MHz clock input: CLKI
- CLKI is available as CLKOUT (separate CLKOUTEN pin associated with output)
 - output state = 0 when disabled

2.8 Miscellaneous

- Hardware / Software Power Save mode
- Input pin to enable/disable Power Save Mode
- General Purpose Input/Output pins are available (GPIO[7:0])
 - INT pin is associated with selectable GPIO inputs
- Package: S1D13743F00A QFP20 144-pin package

DE	0	3	НО	PIOVDD	L	L	This output pin is the Data Enable.	

Note

The LCD interface requires a separate power rail (PIOVDD) to support the configurable IO drive. For details, see the CNF2 description in Section 4.3, "Summary of Configuration Options" on page 17.

Note

The input function of VD[23:0] is used for production test only.

4.2.3 Clocks

Table 4-3: Clock Input Pin Descriptions

Pin Name	Туре	QFP Pin#	Cell	IO Voltage	RESET# State	Power Save Status	Description
CLKI	I	115	HIS	IOVDD	Input	Input	MHz input for PLL operation or MHz input if PLL is bypassed.
CLKOUT	0	110	НО	IOVDD	L	CLKI	This output pin represents the CLKI pin if enabled by CLKOUTEN. When disabled, the output is low. Note: This output is not affected by the various power save modes.
CLKOUTEN	I	112	Н	IOVDD	Input	Input	This pin enables/disables the CLKOUT pin.

4.2.4 Miscellaneous

Table 4-4: Miscellaneous Pin Descriptions

Pin Name	Туре	QFP Pin #	Cell	IO Voltage	RESET# State	Power Save Status	Description
CNF[2:0]	I	76,77,78	НІ	IOVDD	ft		These inputs are used for power-up configuration. For further details, see Section 4.3, "Summary of Configuration Options" on page 17.
							Note: These pins must be connected directly to IOVDD or VSS.
TESTEN	I	94	LIDS	IOVDD	- - c		This is the Test Enable input and is used for production test only. This pin should be left unconnected for normal operation.
GPIO[7:0]	Ю	66,67,71,72, 81,82,83,84	HBD	IOVDD	L Pull-down		These pins are general purpose input/output pins. These pins have internal pull-down resistors which can be controlled using REG[64h].
PWRSVE	I	70	HID	IOVDD			This pin enables/disables the Standby Power Save Mode. This pin has an internal pull-down resistor which is always active.
TEST[2:0]	I	89,90,93	HID	IOVDD	_	 These are Test Function pins and are used for pitest only. These pins should be left unconnected for norm 	
SCANEN	I	87	HID	IOVDD	_	_	This is the Test Scan Enable input and is used for production test only. This pin should be left unconnected for normal operation.
VCP	I	121	LITR	PLLVDD	_	_	This is the PLL VCP Test pin and is used for production test only. This pin should be left unconnected for normal operation.
NC	_	11,16,17,22, 23,24,25,29, 30,31,32,33, 34,35,36,37, 73,88,109, 111,117, 118,123	_	_	_	_	These pins are not connected.

4.2.5 Power And Ground

Table 4-5: Power And Ground Pin Descriptions

Pin Name	Туре	QFP Pin #	Cell	Description	
COREVDD	Р	6,26,41,52,64,74, 95,114,133	P Core power supply		
IOVDD	Р	68,79,85,91,100, 105,119,128,139	P IO power supply for the host interface		
PIOVDD	Р	1,9,18,28,46,58	P IO power supply for the panel interface		
PLLVDD	Р	120	Р	PLL power supply	
PLLVSS	Р	122	Р	GND for PLL	
VSS	Р	2,7,10,19,27,42, 47,53,59,65,69, 75,80,86,92,96, 99,104,113,116, 129,134,140	Р	GND	

4.3 Summary of Configuration Options

These pins are used for power-up configuration and must be connected directly to IOV_{DD} or V_{SS} . Changing the state of these pins is only permitted when RESET# is low (active). The status of these pins can be read in REG[02h] using the CNF[2:0] Status bits.

Table 4-6: Summary of Power-On/Reset Options

Configuration	Power-On/Reset State						
Input	1 (connected to IOV _{DD})	0 (Connected to V _{SS})					
CNF0	Host Data Lines are normal: If CNF1 = 1b, then D15 = D15, etc. If CNF1 = 0b, then D7 = D7, etc.	Host Data Lines are swapped: If CNF1 = 1b, then D15 = D0, etc. If CNF1 = 0b, then D7 = D0, etc.					
CNF1	Host Data is 16-bit (see Note)	Host Data is 8-bit (see Note)					
CNF2	PIOVDD output current = 6.5mA	PIOVDD output current = 2.5mA					

Note

When CNF1 = 0b, all register access is 8-bit only.

When CNF1 = 1b (16-bit), all register access is 8-bit ONLY (most significant byte on the data bus is ignored) except for the Memory Data Port (REG[48h] \sim REG[49h]) which is 16-bit.

5 Pin Mapping

5.1 Intel 80 Data Pins

Intel 80 data pin mapping is controlled by CNF[1:0]. For details on CNF[1:0], see Section 4.3, "Summary of Configuration Options" on page 17.

Table 5-1: Intel 80 Data Pin Mapping

Pin Name	16-Bit Data No Swap (CNF1=1b, CNF0=1b)	16-Bit Data Swapped (CNF1=1b, CNF0=0b)	8-Bit Data No Swap (CNF1=0b, CNF0=1b)	8-Bit Data Swapped (CNF1=0b, CNF0=0b)
MD15	MD15	MD0	Hi-Z	Hi-Z
•	•	•	•	•
MD8	MD8	MD7	Hi-Z	Hi-Z
MD7	MD7	MD8	MD7	MD0
•	•	•	•	•
MD0	MD0	MD15	MD0	MD7

5.2 LCD Interface Data Pins

LCD interface data pin mapping is controlled by REG[14h] bit 7.

Table 5-2: LCD Interface Data Pin Mapping for 24-bit Panels

Pin Name	24-Bit Data No Swap REG[14h] bit 7 = 0b	24-Bit Data Swapped REG[14h] bit 7 = 1b

6 D.C. Characteristics

6.1 Absolute Maximum Ratings

Table 6-1: Absolute Maximum Ratings

Symbol	Parameter	Rating	Units
Core V _{DD}	Core Supply Voltage	V _{SS} - 0.3 ~ 2.0	V
PLL V _{DD}	PLL Supply Voltage	V _{SS} - 0.3 ~ 2.0	V
IO V _{DD}	Host IO Supply Voltage	Core V _{DD} ~ 4.0	V
PIO V _{DD}	Panel IO Supply Voltage	Core V _{DD} ~ 4.0	V
V _{IN}	Input Signal Voltage	V _{SS} - 0.3 ~ IO V _{DD} + 0.3	V
V _{OUT}	Output Signal Voltage	V _{SS} - 0.3 ~ IO V _{DD} + 0.3	V
I _{OUT}	Output Signal Current	±10	mA

6.2 Recommended Operating Conditions

Table 6-2: Recommended Operating Conditions

Symbol	Parameter	Condition	Min	Тур	Max	Units
Core V _{DD}	Core Supply Voltage	V _{SS} = 0 V	1.40	1.50	1.60	V
PLL V _{DD}	PLL Supply Voltage	V _{SS} = 0 V	1.40	1.50	1.60	V
IO V _{DD}	Host IO Supply Voltage	V _{SS} = 0 V	1.65	_	3.6	V
PIO V _{DD}	Panel IO Supply Voltage	V _{SS} = 0 V	1.65	_	3.6	V
V _{IN}	Input Voltage	_	V _{SS}	_	IO V _{DD}	V
T _{OPR}	Operating Temperature	_	-40	+25	+85	- C

Note

There are no special Power On/Off requirements with respect to sequencing the various VDD pins. There are also no special requirements for the IO signals, however, Inputs should not be floating. If the input signals were to power up in a valid cycle, the S1D13743 would decode the cycle.

6.3 Electrical Characteristics

The following characteristics are for: IO $V_{DD}, \\ V_{SS} = 0V, T_{OPR} = -40 \text{ to } +85^{\circ}C.$

Table 6-3: Electrical Characteristics for IOVDD or PIOVDD = $1.8V \pm 0.15V$

Symbol	Parameter	Condition	Min	Тур	Max	Units
I _{QALL}	Quiescent Current	CLKI stopped (grounded), Sleep Mode enabled, all power supplies active	_	100	_	μА
I _{PLL}	PLL Current	f _{PLL} = 54MHz	_	500	1000	μΑ
I _{CORE}	Operation Peak Current	COREVDD Power Pin	_	_	74	mA

7 A.C. Characteristics

7.1 Clock Timing

7.1.1 Input Clocks

Figure 7-1 Clock Input Required (CLKI)

Symbol	Parameter	Min	Тур	Max	Units
fosc	Input clock frequency - PLL used for System Clock	1	_	33	MHz
(see note 1)	Input clock frequency - CLKI used for System Clock	0	_	68.59	MHz
tosc	Input clock period	_	1/f _{OSC}	_	μs
t1	Input clock pulse width high	0.4t _{OSC}	_	0.6t _{OSC}	μs
t2	Input clock pulse width low	0.4t _{OSC}	_	0.6t _{OSC}	μs
t3	Input clock rise time (10% ~ 90%)	_	_	5.0	ns
t4	Input clock fall time (90% ~ 10%)	_	_	5.0	ns
t5	Input clock period jitter (see Notes 2 and 4)	-300		300	ps
t6 (see Note 6)	Input clock cycle jitter (see Notes 3 and 4)	-300		300	ps

Table 7-1 Clock Input Requirements (CLKI)

- 1. The minimum System Clock frequency required for correct operation depends on the cycle length of the Intel 80 interface. See Section 9.4, "Setting SYSCLK and PCLK" on page 42 for more details.
- 2. The input clock period jitter is the displacement relative to the center period (reciprocal of the center frequency).
- 3. The input clock cycle jitter is the difference in period between adjacent cycles.
- 4. The jitter characteristics must satisfy both the t5 and t6 characteristics.
- 5. Input Duty cycle is not critical and can be 40/60.
- 6. $t6 = 2 \times t_{OSC}$

7.1.2 PLL Clock

The PLL circuit is an analog circuit and is very sensitive to noise on the input clock waveform or the power supply. Noise on the clock or the supplied power may cause the operation of the PLL circuit to become unstable or increase the jitter.

Due to these noise constraints, it is highly recommended that the power supply traces or the power plane for the PLL be isolated from those of other power supplies. Filtering should also be used to keep the power as clean as possible. The jitter of the input clock waveform should be as small as possible.

Figure 7-2: PLL Start-Up Time

Table 7-2: PLL Clock Requirements

Symbol	Parameter	Min	Max	Units
f _{PLL}	PLL output clock frequency	44.28 (Note 1)	66.53	MHz
t _{PJref}	PLL output clock period jitter	-3	3	%
t _{PDuty}	PLL output clock duty cycle	40	60	%
t _{PStal}	PLL output stable time		10	ms

1. Refer to Section 9.4, "Setting SYSCLK and PCLK" on page 42.

7.2 RESET# Timing

Figure 7-3 S1D13743 RESET# Timing

Table 7-3 S1D13743 RESET# Timing

Symbol	Parameter	Min	Max	Units
t1	Active Reset Pulse Width	1	_	CLKI

7.3 Host interface Timing

7.3.1 Intel 80 Interface Timing - 1.8 Volt

Note 1: The D/C# input pin is used to distinguish between Address and Data.

Note 2: The CS# pin can be kept low between write and read pulses as the register addresses will auto-increment. The register address will auto-increment in word increments for all register access except the Memory Data Port. Writes to the Memory Data Port will not increment the register address to support burst data writes to memory.

Note 3: When CNF1=0, only MD[7:0] are used.

When CNF1=1, MD[15:0] are used for accesses to the Memory Data Port. MD[7:0] are used for all other accesses.

		^t rdd	RD# falling edge to MD driven	3	-	ns	CL = 8pF

Note

- 1. For a read cycle after a write cycle, MD[15:0] must be driven Hi-Z a maximum of t_{rdd} after the falling edge of RD#.
- 2. For a write cycle after a read cycle, MD[15:0] should not be driven by the host until t_{rrdz} after the rising edge of RD#.
- 3. Assumes CS# remains low. After the rising edge of RD#, if CS# goes high before t_{rrdz} then MD[15:0] will go to High-Z according to t_{crdz}.
- 4. When CNF1=0, only MD[7:0] are used. When CNF1=1, MD[7:0] are used for all accesses except for the Memory Data Port when MD[15:0] are used.

7.3.2 Intel 80 Interface Timing - 3.3 Volt

Note 1: The D/C# input pin is used to distinguish between Address and Data.

Note 2: The CS# pin can be kept low between write and read pulses as the register addresses will auto-increment. The register address will auto-increment in word increments for all register access except the Memory Data Port. Writes to the Memory Data Port will not increment the register address to support burst data writes to memory.

Note 3: When CNF1=0, only MD[7:0] are used.

When CNF1=1, MD[15:0] are used for accesses to the Memory Data Port. MD[7:0] are used for all other accesses.

Table 7-5: Intel 80 Input A.C. Characteristics - 3.3 Volt

Note

- 1. For a read cycle after a write cycle, MD[15:0] must be driven Hi-Z a maximum of t_{rdd} after the falling edge of RD#.
- 2. For a write cycle after a read cycle, MD[15:0] should not be driven by the host until t_{rrdz} after the rising edge of RD#.
- 3. Assumes CS# remains low. After the rising edge of RD#, if CS# goes high before t_{rrdz} then MD[15:0] will go to High-Z according to t_{crdz}.

4. When CNF1=0, only MD[7:0] are used. When CNF1=1, MD[7:0] are used for all accesses except for the Memory Data Port when MD[15:0] are used.

7.3.3 Definition of Transition Time to Hi-Z State

Due to the difficulty of Hi-Z impedance measurement for high speed signals, transition time from High/Low to Hi-Z specified as follows.

- High to Hi-Z delay time: t_{pHZ} , delay time when a gate voltage of final stage of the Pch-MOSFET turns to 0.8 x IOVDD (Pch-MOSFET is off). Total delay time to Hi-Z is calculated as follows: Internal logic delay + t_{pHZ} (from High to Hi-Z)
- Low to Hi-Z delay time: t_{pLZ}, delay time when a gate voltage of final stage of the Nch-MOSFET turns to 0.2 x IOVDD (Nch-MOSFET is off). Total delay time to Hi-Z is calculated as follows:

Internal logic delay + t_{pHZ} (from High to Hi-Z)

The functional model of a final stage of the Tri state Output Cell is shown in Figure 7-6: "Definition of transition time to Hi-Z state".

Figure 7-6: Definition of Transition Time to Hi-Z State

7.4 Display Interface

The timing parameters required to drive a flat panel display are shown below. Timing details for each supported panel type are provided in the remainder of this section.

Figure 7-7: Panel Timing Parameters

Table 7-6: Panel Timing Parameter Definition and Register Summary

Symbol	Description	Derived From	Units
HDISP	Horizontal Display Width	REG[16h] bits 6-0 x 8

t13	DE to PCLK rising edge setup time	0.5	_	_	Ts
t14	DE hold from PCLK rising edge	0.5	_	_	Ts
t15	Data setup to PCLK rising edge	0.5	_	_	Ts
t16	Data hold from PCLK rising edge	0.5	_	_	Ts
t17	DE Stop setup to VS start	_	VPS	_	Ts
t18	Vertical Non-Display Period	_	VNDP	_	Ts

1. Ts = pixel clock period

Note

In 24-bit mode, the data is always guaranteed to be launched on the correct edge of PCLK. In this mode, the frequency of PCLK is ½ the programmed internal value. If it is desired that HS and VS are always launched on the same edge of PCLK as the data, then HNDP, HSW, and HSS should be programmed with even values.

8 Memory

The S1D13743 contains 464K bytes of embedded SRAM. The SRAM consists of two banks, the first is 304K bytes and the second is 160K bytes in size, each bank being mapped at contiguous addresses.

Figure 8-1: S1D13743 Physical Memory

All data written into memory, regardless of input data format, is in RGB 8:8:8 format. The following tables show how the pixel data is stored in the S1D13743 memory.

9 Clocks

9.1 Clock Descriptions

Figure 9-1: S1D13743 Clock Block Diagram

9.2 PLL Block Diagram

Figure 9-2: PLL Block Diagram

9.3 Clocks versus Functions

The following table summarizes the internal clocks that are required for various S1D13743 functions.

Table 9-1: Internal Clock Requirements

Function	Internal SYSCLK	Internal PCLK				
Register Read/Write	No	No				
Memory Read/Write	Yes	No				
Look-Up Table Register Read/Write	Yes	No				
Power Save	No	No				
LCD Output	Yes	Yes				

Note

Register accesses do not require an internal clock as the S1D13743 creates a clock from the bus cycle alone.

9.4 Setting SYSCLK and PCLK

The period of the system clock, TSYSCLK, must be set such that it falls within the following range:

For PLL: 15.03ns $< T_{SYSCLK} < (T_{BBC} - 0.976)$ x 0.485ns For CLKI: 14.58ns $< T_{SYSCLK} < (T_{BBC} - 0.976)$ x 0.5ns

where T_{BBC} is the minimum back-to-back cycle time of the Intel 80 Interface.

For example, if the minimum back-to-back cycle time of the Intel 80 Interface is 47.5ns, then:

For PLL: 15.03ns $< T_{SYSCLK} < 22.584$ ns For CLKI: 14.58ns $< T_{SYSCLK} < 23.262$ ns

Therefore,

For PLL: 44.28MHz < f_{SYSCLK} < 66.53MHz For CLKI: 42.99MHz < f_{SYSCLK} < 68.59MHz

Care should be taken when setting T_{SYSCLK} so that the desired PCLK frequency, f_{PCLK} , can be achieved. PCLK is an integer divided version of SYSCLK. The following graph shows the suggested setting for SYSCLK for a given value of PCLK for $T_{BBC} = 47.5 \, \text{ns}$.

Figure 9-3: Setting of SYSCLK for a Desired PCLK

10 Registers

This section discusses how and where to access the S1D13743 registers. It also provides detailed information about the layout and usage of each register.

Burst data writes to the register space are supported for all register write accesses, except write accesses to the Memory Data Port (REG[48h] ~ REG[49h]) and the Gamma Correction Table Data Register [REG[54h]). All writes to these registers will auto-increment the internal memory address only.

10.1 Register Mapping

All registers and memory are accessed via the Intel 80 interface. All accesses are 8-bit only except for the Memory Data Port (REG[48h ~ 49h]) which is accessed according to the configuration of the CNF1 pin (16-bit for CNF1 = 1b, 8-bit for CFN1 = 0b). For further information on this setting, see Section 4.3, "Summary of Configuration Options" on page 17.

10.2 Register Set

The S1D13743 registers are listed in the following table.

Table 10-1: S1D13743 Register Set

10.3 Register Descriptions

All reserved bits must be set to the default value. Writing a non-default value to a reserved bit may produce undefined results. Bits marked as n/a have no hardware effect. Unless specified otherwise, all register bits are set to 0b during power-on reset.

10.3.1 Read-Only Configuration Registers

REG[00h] R	evision Code	Register										
Default = 98	Default = 98h											
	Product Code bits 5-0 F											
7	6	1	0									
bits 7-2	bits 7-2 Product Code bits [5:0] (Read Only) These read-only bits indicate the product code. The product code for the S1D13743 is 100110b.											
bits 1-0			ts [1:0] (Read of the control of the	• /	e. The revision	code is 00b.						

F	REG[02h] Configuration Readback Register												
	Default = xxh Read Only												
			n/a			CNF2 Status	CNF1 Status	CNF0 Status					
	7	6	5	4	3	2	1	0					

bits 2-0 CNF[2:0] Status (Read Only)

These read-only status bits return the status of the configuration pins CNF[2:0]. For details on CNF[2:0] functionality, see Section 4.3, "Summary of Configuration Options" on page 17.

10.3.2 Clock Configuration Registers

REG[04h] PLL M-Divider Register Default = 00h Read/Write													
PLL Lock (RO)	n/a		M-Divider bits 5-0										
7	6	5	4	3	2	1	0						

bit 7 PLL Lock (Read Only)

This bit indicates the status of the PLL output.

When this bit = 0, the PLL output is not stable. In this state read/write access to the display buffer is prohibited.

When this bit = 1, the PLL output is stable.

bits 5-0 M-Divider bits [5:0]

These bits determine the divide ratio between CLKI and the actual input clock to the PLL

Note

The internal input clock to the PLL (PLLCLK) must be between 1 MHz and 2 MHz. Depending on CLKI, these bits will have to be set accordingly.

Note

Values higher than 20h are not allowed.

Table 10-2: PLL M-Divide Selection

REG[04h] Bits 5-0	M-Divide Ratio
0h	1:1
01h	2:1
02h	3:1
03h	4:1
•	•
•	•
•	•
20h	33:1
21h to 3Fh	Reserved

REG[06h]	REG[06h] PLL Setting Register 0													
Default = 0	Default = 00h Read/Write													
	PLL Setting Register 0 bits 7-0													
7		6		5		4		3		2		1	0	

This register must be programmed with the value F8h.

REG[08h] PLL Setting Register 1 Default = 00h Read/Write														
PLL Setting Register 1 bits 7-0														
7		6		5		4		3		2		1		0

This register must be programmed with the value 80h.

	REG[0Ah] PLL Setting Register 2 Default = 00h Read/Write												
	PLL Setting Register 2 bits 7-0												
7	6	5	4	3	2	1	0						

This register must be programmed with the value 28h.

REG[0Ch]	REG[0Ch] PLL Setting Register 3												
Default = 00h Read/Write													
PLL Setting Register 3 bits 7-0													
7		6		5		4	3		2		1	0	

This register must be programmed with the value 00h.

REG[0Eh] PL Default = 00h	_	gister 4					Read/Write				
n/a		L-Counter bits 6-0									
7	6	5	4	3	2	1	0				

bits 6-0 L-Counter bits [6:0]

These bits are used to configure the PLL Output (in MHz) and must be set according to the following formula.

PLL Output =
$$(L-Counter + 1) \times PLLCLK$$

= $LL \times PLLCLK$

Where:

PLL Output is the desired PLL output frequency (in MHz).

L-Counter is the value of this register (in decimal).

PLLCLK is the internal input clock to the PLL (in MHz).

Table 10-3 PLL Setting Example

Target Frequency (MHz)	LL	CLKI Input Clock (MHz)	M-Divider REG[04h] bits 5-0	M-Divide Ratio	PLLCLK (MHz)	POUT (MHz)
53	53	12	0Bh	12:1	1.0	53
60	60	12	0Bh	12:1	1.0	60
•	•	•	•	•	•	•
53	53	19.2	12h	19:1	1.0105	53.53
60	60	19.2	12h	19:1	1.0105	60.63

	REG[10h Default =												Read/V	Vrite
								n/a	3					
L	7		6		5		4		3		2	1	0	

Writes to this register have no effect on hardware. During Auto Increment, a dummy write must be performed to this register.

REG[12h] C Default = 00		Source	Seled	t Regis	ter						Read/Write
	PCLK Divide Select bits 4-0									n/a	SYSCLK Source Select
7		6		5	2	1	0				

bits 7-3 PCLK Divide Select bits [4:0]

These bits specify the divide ratio for the panel clock (PCLK) frequency.

The clock source for PCLK is SYSCLK.

All resulting clock frequencies will maintain a 50/50 duty cycle regardless of divide ratio.

Table 10-4 PCLK Divide Ratio Selection

REG[12h] bits 7-3	PCLK Divide Ratio

bit 0 SYSCLK Source Select

This bit selects the source of the system clock (SYSCLK) for the S1D13743.

When this bit = 0, the SYSCLK source is the external CLKI input.

When this bit = 1, the SYSCLK source is the internal PLL.

If the PLL is selected as the SYSCLK source (REG[12h] bit 0 = 1b), the PLL must be configured using REG[06h], REG[08h], REG[0Ah], REG[0Ch], REG[0Eh] and REG[10h] before setting these bits.

Note

The PLL output will become stable after 10ms. The display memory and the Gamma Correction Table must not be accessed before PLL output is stable. The PLL Lock bit, REG[04h] bit 7, can be used to determine if the PLL output is stable.

10.3.3 Panel Configuration Registers

REG[14h] Pa	REG[14h] Panel Type Register												
Default = 00h Read/Write													
VD Data Swap	Swap n/a												
7	6	5	4	3	2	1	0						

bit 7 VD Data Swap

This bit determines whether the panel data lines (VD[23:0]) are swapped. If enabled, the data swap is from the msb to the lsb on the active output pins as shown in Table 5-2: "LCD Interface Data Pin Mapping for 24-bit Panels," on page 19 and Table 5-3: "LCD Interface Data Pin Mapping for 18-bit Panels," on page 19.

When this bit = 0, the data lines are normal (i.e. output pin VD23 = VD23, etc.). When this bit = 1, the data lines are swapped (i.e. output pin VD23 = VD0, etc.).

bit 0 Panel Data Width

This bit specifies the data width for the LCD interface.

When this bit = 0, the LCD interface is configured as 18-bit (1 pixel / clock). When this bit = 1, the LCD interface is configured as 24-bit (1 pixel / clock).

REG[16h] Ho	REG[16h] Horizontal Display Width Register (HDISP)											
Default = 01h Read/Write												
n/a	n/a Horizontal Display Width bits 6-0											
7	6	5	4	3	2	1	0					

bits 6-0

Horizontal Display Width bits [6:0]

These bits specify the Horizontal Display Width (HDISP) for the LCD panel, in 8 pixel resolution.

HDISP in number of pixels = $(REG[16h] bits 6-0) \times 8$

Note

The minimum Horizontal Display Width is 8 pixels (REG[16h] bits 6-0 = 01h).

	REG[18h] Horizontal Non-Display Period Register (HNDP) Default = 00h Read/Write											
Default = 00h												
n/a	n/a Horizontal Non-Display Period bits 6-0											
7	6	5	4	3	2		1	0				

bits 6-0 Horizontal Non-Display Period bits [6:0]

These bits specify the Horizontal Non-Display Period (HNDP), in pixels.

HNDP in pixels = REG[18h] bits 6-0

Note

The minimum Horizontal Non-Display Period is 3 Pixels (REG[18h] bits 6-0 = 03h). HS Start + HS Width \leq HNDP

REG[1Ah] Vertical Display Height Register 0 (VDISP) Default = 01h Read/Write											
Vertical Display Height bits 7-0											
7		6		5	4	3	2	1	0		

	REG[1Ch] Vertical Display Height Register 1 (VDISP)											
Default = 00h	Default = 00h Read/Write											
	n/a Vertical Display Height bits 9-8											
7	6	5	4	3	2	1	0					

REG[1Ch] bits 1-0

REG[1Ah] bits 7-0

Vertical Display Height bits [9:0]

These bits specify the Vertical Display Height (VDISP) for the LCD panel, in lines. VDISP in lines = (REG[1Ch] bits 1-0, REG[1Ah] bits 7-0)

Note

The minimum Vertical Display Height is 1 line (REG[1Ch] bits 1-0, REG[1Ah] bits 7-0 = 001h).

REG[1Eh]	REG[1Eh] Vertical Non-Display Period Register (VNDP)											
Default = 0	Default = 01h Read/Write											
	Vertical Non-Display Period bits 7-0											
7		6	5		4	3	2	1	0			

bits 7-0

bits 6-0

Vertical Non-Display Period bits [7:0]

These bits specify the Vertical Non-Display Period (VNDP) for the LCD panel, in lines. VNDP in lines = REG[1Eh] bits 7-0

Note

The minimum Vertical Non-Display Period is 2 lines (REG[1Eh] bits 7-0 = 02h).

REG[20h] HS Pulse Width Register (HSW) Default = 00h Read/Write										
HS Pulse Polarity	HS Pulse Width bits 6-0									
7	6	5	4		3	2	1	0		

bit 7 HS Pulse Polarity

This bit selects the polarity of the horizontal sync signal. This bit is set according to the horizontal sync signal of the panel.

When this bit = 0, the horizontal sync signal is active low. When this bit = 1, the horizontal sync signal is active high.

HS Pulse Width bits [6:0]

These bits specify the width of the horizontal sync signal for the LCD panel (HSW), in pixels. The horizontal sync signal is typically HS, depending on the panel type.

HSW in pixels = REG[20h] bits 6-0

	REG[22h] HS Pulse Start Position Register (HPS) Default = 00h Read/Write										
Dolaalt = 0011											
n/a	HS Pulse Start Position bits 6-0										
7	6	5	4	3	2	1	0				

bits 6-0

HS Pulse Start Position bits [6:0]

These bits specify the start position of the horizontal sync signal with respect to the start of Horizontal Non-Display period (HPS), in pixels.

HPS in pixels = REG[22h] bits 6-0

	REG[24h] VS Pulse Width Register (VSW) Default = 00h Read/Write									
VS Pulse Polarity	n/a		VS Pulse Width bits 5-0							
7	6	5	4		3	2	1	0		

bit 7 VS Pulse Polarity

This bit selects the polarity of the vertical sync signal. This bit is set according to the vertical sync signal of the panel.

When this bit = 0, the vertical sync signal is active low.

When this bit = 1, the vertical sync signal is active high.

bits 5-0 VS Pulse Width bits [5:0]

These bits specify the width of vertical sync signal for the panel (VSW), in lines. The vertical sync signal is typically VS, depending on the panel type.

VSW in lines = REG[24h] bits 5-0

	REG[26h] VS Pulse Start Position Register (VPS) Default = 00h Read/Write										
	VS Pulse Start Position bits 7-0										
7	6	5	4	3	2	1	0				

bits 7-0

VS Pulse Start Position bits [7:0]

These bits specify the start position of the vertical sync signal with respect to the start of Vertical Non-Display period (VPS), in lines.

VPS in lines = REG[26h] bits 7-0

bit 7

PCLK Polarity

This bit selects the polarity of PCLK.

When this bit = 0, data is output on the rising edge of PCLK.

When this bit = 1, data is output on the falling edge of PCLK.

10.3.4 Input Mode Register

	REG[2Ah] Input Mode Register									
Default = 01h	l						Read/Write			
	n	/a		Input Data Format bits 3-0						
7	6	5	4	3	2	1	0			

bits 3-0

Input Data Format bits [3:0]

These bits select the input data format. For further information on Input Data Format and Memory Data Format, see Section 13, "Intel 80, 8-bit Interface Color Formats" on page 73, Section 14, "Intel 80, 16-bit Interface Color Formats" on page 76 and Section 15, "YUV Timing" on page 81.

REG[2Ah] bits 3-0 **Input Data Type** 0000b Reserved 0001b RGB 5:6:5 0010b RGB 6:6:6 Mode 1 RGB 8:8:8 Mode 1 0011b 0100b Reserved 0101b Reserved 0110b RGB 6:6:6 Mode 2 0111b RGB 8:8:8 Mode 2 1000b YUV 4:2:2

Table 10-5: Input Data Type Selection

Note

All input data is stored as 24 bpp.

1001b 1010b ~ 1111b

Note

For YUV 4:2:2 and YUV 4:2:0 settings, the image width must be a multiple of 2 and 4 respectively. For YUV 4:2:0 the height must be a multiple of 2.

YUV 4:2:0

Reserved

For RGB 6:6:6 and RGB 8:8:8 Mode 1, if the image width is odd, the red pixel data in the last word in each line will be ignored. The red pixel data will need to be re-written on the following transfer along with the green data. See Figure 14-2: "18 bpp Mode 1 (R 6-bit, G 6-bit, B 6-bit), 262,144 colors," on page 77 or Figure 14-4: "24 bpp Mode 1 (R 8-bit, G 8-bit, B 8-bit), 16,777,216 colors," on page 79.

Note

RGB 6:6:6 mode 2 and RGB 8:8:8 mode 2 settings are not available for 8-bit host interface.

REG[2Ch] Inp Default = 00h	REG[2Ch] Input YUV/RGB Translate Mode Register 0 Default = 00h Read/Write										
Reserved	YRC Reset	UV Fix	bits 1-0	n/a							
7	6	5	5 4 3 2 1								

bit 7 Reserved

The default value for this bit is 0b.

bit 6 YRC Reset

This bit performs a software reset of the YRC (YUV to RGB Converter). To perform a

reset, write a 1b to enter reset, and then write a 0b to return from the reset state.

For Reads:

When this bit = 0, the YRC is not in a reset state.

When this bit = 1, the YRC is in a reset state.

For Writes:

Writing a 0 to this bit returns the YRC from the reset state.

Writing a 1 to this bit initiates a software reset of the YRC.

bits 5-4 UV Fix Select bits [1:0]

These bits control the UV input to the YRC (YUV to RGB Converter).

Table 10-6: UV Fix Selection

REG[2Ch] Bits 5-4	UV Input to the YRC
00b	Original U data, original V data
01b	U data = REG[32h] bits 7-0, original V data
10b	Original U data, V data = REG[34h] bits 7-0
11b	U data = REG[32h] bits 7-0, V data = REG[34h] bits 7-0

REG[2Eh] Inp Default = 05h	REG[2Eh] Input YUV/RGB Translate Mode Register 1 Default = 05h Read/Write

7 6 5 4 3 2 1 0									

bits 7-6 Reserved

The default value for these bits is 00b.

bits 5-4 YUV Input Data Type Select bits [1:0]

These bits specify the data type of the YUV input to the YUV to RGB Converter (YRC).

Table 10-7: YUV Data Type Selection

REG[2Eh] bits 5-4	YRC Input Data Range
00b	0 ≤ Y ≤ 255 -128 ≤ U ≤ 127 -128 ≤ V ≤ 127
01b	16 ≤ Y ≤ 235 -113 ≤ U ≤ 112 -113 ≤ V ≤ 112
10b	$0 \le Y \le 255$ $0 \le U \le 255$ $0 \le V \le 255$
11b	$16 \le Y \le 235$ $16 \le U \le 240$ $16 \le V \le 240$

bit 3 Reserved

The default value for this bit is 0b.

bits 2-0 YUV/RGB Transfer Mode bits [2:0]

These bits specify the YUV/RGB Transfer mode. Recommended settings are provided for various specifications.

Table 10-8: YUV/RGB Transfer Mode Selection

REG[2Eh] bits 2-0	YUV/RGB Specification				
000b	Reserved				
001b	Recommended for ITU-R BT.709				
010b	Reserved				
011b	Reserved				
100b	Recommended for ITU-R BT.470-6 System M				
101b (Default)	Recommended for ITU-R BT.470-6 System B, G (Recommended for ITU-R BT.601-5)				
110b	SMPTE 170M				
111b	SMPTE 240M(1987)				

REG[30h] Default = 0		a Fix Re	egistei	•								Read/Write
	U Data Fix bits 7-0											
7		6		5		4	3		2		1	0

bits 7-0 U Data Fix bits [7:0]

These bits only have an effect when the UV Fix Select bits are set to 01b or 11b (REG[2Ch] bits 5-4 = 01b or 11b). The U data input to the YRC (YUV to RGB Converter) is fixed to the value of these bits.

REG[32h] V	REG[32h] V Data Fix Register											
Default = 00h Read/Write												
	V Data Fix bits 7-0											
7	6	5	4	3	2	1	0					

bits 7-0 V Data Fix bits [7:0]

These bits only have an effect when the UV Fix Select bits are set to 10b or 11b (REG[2Ch] bits 5-4 = 10b or 11b). The V data input to the YRC (YUV to RGB Converter) is fixed to the value of these bits.

10.3.5 Display Mode Registers

REG[34h] Di	REG[34h] Display Mode Register											
Default = 08h Read/Write												
Display Blank	FR	M Mode Select bits	2-0	Reserved	n/a	SwivelView Mod	le Select bits 1-0					
7	6	5	4	3	2	1	0					

bit 7 Display Blank

This bit blanks the display by disabling the LCD display pipeline and forcing all LCD data

outputs to zero.

When this bit = 0, the LCD display pipeline is enabled and the display is active. When this bit = 1, the LCD display pipeline is disabled and the display is blanked.

bits 6-4 FRM Mode Select bits [2:0]

These bits select the FRM mode.

Note

When the output is 24 bpp, set REG[34] bits 6-4 = 000b

Table 10-9: FRM Mode Selection

REG[34h] bits 6-4	FRM Mode Selected			
000b	Normal mode			
001b	18 bpp Bypass			
010b	FRM			
011b	Reserved			
100b	Dithering			
101b	Reserved			
110b	FRM + Dithering			
111b	Reserved			

bit 3 Reserved

The default value for this bit is 1b.

bits 1-0 Window SwivelView Mode Select bits [1:0]

These bits select the SwivelViewTM orientation that will be applied to the window. Each window on the active display can have independent rotation, as the rotation is performed prior to writing to the display buffer.

Table 10-10: SwivelView Mode Select Options

REG[34h] bits 1-0	SwivelView Orientation
00b	0° (Normal)
01b	90°
10b	180°
11b	270°

REG[36h] Sp	REG[36h] Special Effects Register										
Default = 00h Read/Write											
Window Data Type	Double Buffer Enable			Window Pixel	Sizing bits 1-0						
7	6	5	4		3	2	1	0			

bit 7 Window Data Type

This bit is used in conjunction with the Double Buffer Enable bit (REG[36h] bit 6) and determines whether the data being input from the host will be double-buffered. This bit must be set before the window data is written, as the window coordinates will be latched internally to be used by the display pipe during display cycles.

When this bit = 0, the data being written from the Host is intended for single buffer only. When this bit = 1, the data being written from the Host is intended for double buffer operation.

Table 10-11: Window Data Type / Buffer Selection

REG[36h] Bit 7	REG[36h] Bit 6	Use Case
0b	0b	Single buffered window with no double buffering anywhere on the display.
0b	1b	Use this to write a single buffered window while preventing tearing in a previously defined double buffered window.
1b	0b	Reserved
1b	1b	Use this to write data to be double buffered.

Note

While double buffering is enabled, the window coordinates should not be modified.

Note

If the Input Data Format is YUV 4:2:0 (REG[2Ah] bits 3-0 = 1001b), the Window Data Type bit must not be changed while the YYC is busy (REG[58h] bit 4 = 1b).

bit 6

Double Buffer Enable

This bit is used in conjunction with the Window Data Type bit (REG[36h] bit 7) and controls the Double Buffer architecture. Double buffering is intended to prevent visual tearing when updating the display from streaming input sources. This bit must be set before the window data is written, as the window coordinates will be latched internally to be used by the display pipe during display cycles.

When this bit = 0, the double buffer architecture is disabled.

When this bit =1, the double buffer architecture is enabled. This feature is only available if the memory size resulting from the display size and color depth will fit within the 1/2 the allowable size for the display buffer.

For a summary of Window Data Type / Double Buffer options, see Table 10-11: "Window Data Type / Buffer Selection," on page 58.

Note

While double buffering is enabled, the window coordinates should not be modified.

Note

Only one window can be double-buffered. All other windows are single buffered.

bits 1-0 Window Pixel Sizing bits [1:0]

These bits control resizing of the window data.

These bits must be set before the window data is written, as the window coordinates will be latched internally to be used by the display pipe during display cycles.

REG[36h] bits 1-0	Result
00b	No Resizing
01b	Pixel Doubling
10b	Pixel Halving
11b	Reserved

Table 10-12: Window Pixel Sizing

Note

Only 1 active window can have pixel doubling enabled. The pixel doubling design uses horizontal and vertical averaging for smooth doubling.

The following figure provides an example of the resizing options. All resizing is performed with respect to the top left corner.

Figure 10-1: Sizing Example

Note

To disable pixel doubling for a window that is currently pixel doubled, either:

- 1. Overwrite any part of the pixel doubled window with a new window.
- 2. Write a new pixel doubled window.

10.3.6 Window Settings

REG[38h] W	REG[38h] Window X Start Position Register 0												
Default = 00I	Default = 00h Read/Write											Read/Write	
	Window X Start Position bits 7-0												
7	6		5			4		3		2		1	0

REG[3Ah	REG[3Ah] Window X Start Position Register 1											
Default =	Default = 00h Read/Write											
		Window X Start	Position bits 9-8									
7		6	5	4	3	2	1	0				

REG[3Ah] bits 1-0 REG[38h] bits 7-0

Window X Start Position bits [9:0]

These bits determine the X start position of the window in relation to the top left corner of the displayed image. Even in a rotated orientation (see REG[34h] bits 1-0), the top left corner is still relative to the displayed image.

Note

When pixel doubling or pixel halving is enabled (see REG[36h] bits 1-0), these bits should be programmed with the pre-resized coordinates.

	REG[3Ch] Window Y Start Position Register 0 Default = 00h Read/Write										rite		
	Window Y Start Position bits 7-0												
7		6		5		4	3		2		1	0	

REG[3Eh] W	REG[3Eh] Window Y Start Position Register 1											
Default = 00h	Default = 00h Read/Write											
		n	/a			Window Y Start	Position bits 9-8					
7	6	5	4	3	2	1	0					

REG[3Eh] bits 1-0 REG[3Ch] bits 7-0

Window Y Start Position bits [9:0]

These bits determine the Y start position of the window in relation to the top left corner of the displayed image. Even in a rotated orientation (see REG[34h] bits 1-0), the top left corner is still relative to the displayed image.

Note

When pixel doubling or pixel halving is enabled (see REG[36h] bits 1-0), these registers should be programmed with the pre-resized coordinates.

	REG[40h] Window X End Position Register 0 Default = 00h Read/Write											
Delault = 0	Default = 00h											
	Window X End Position bits 7-0											
7		6		5	4	3	2	1	0			

REG[42h] W	REG[42h] Window X End Position Register 1											
Default = 00h	Default = 00h Read/Write											
	n/a											
7	6	5	4	3	2	1	0					

REG[42h] bits 1-0 REG[40h] bits 7-0

Window X End Position bits [9:0]

These bits determine the X end position of the window in relation to the top left corner of the displayed image. Even in a rotated orientation (see REG[34h] bits 1-0), the top left corner is still relative to the displayed image.

Note

When pixel doubling or pixel halving is enabled (see REG[36h] bits 1-0), these registers should be programmed with the pre-resized coordinates.

REG[44h]	REG[44h] Window Y End Position Register 0										
Default = 0	Default = 00h Read/Write										
	Window Y End Position bits 7-0										
7	ĺ	6		5	4	3	2	1	0		

REG[46h] W	REG[46h] Window Y End Position Register 1										
Default = 00h	Default = 00h Read/Write										
	n/a Window Y End Position bits 9-8										
7	6	5	4	3	2	1	0				

REG[46h] bits 1-0 REG[44h] bits 7-0

Window Y End Position bits [9:0]

These bits determine the Y end position of the window in relation to the top left corner of the displayed image. Even in a rotated orientation (see REG[34h] bits 1-0), the top left corner is still relative to the displayed image.

Note

When pixel doubling or pixel halving is enabled (see REG[36h] bits 1-0), these registers should be programmed with the pre-resized coordinates.

10.3.7 Memory Access

	REG[48h] Memory Data Port Register 0										
Detault = not	Default = not applicable Read/Write										
	Memory Data Port bits 7-0										
7	6	5	4	3	2	1	0				

_	REG[49h] Memory Data Port Register 1											
Defau	Default = not applicable Read/Write											
				Memory Data	Port bits 15-8							
	7	6	5	4	3	2	1	0				

REG[48h] bits 7-0 Memory Data Port bits [7:0]

These bits specify the lsb of the data word.

REG[49h] bits 15-8 Memory Data Port bits [15:8]

These bits specify the msb of the data word.

Note

If CNF1=0 (8-bit interface), REG[49h] is not used.

Note

Burst data writes are supported through these registers. Register auto-increment is auto-matically disabled once reaching this address. All writes to this register will auto-increment the internal memory address only.

Note

Panel dimension registers must be set before writing any window data.

Note

Upon writing the last pixel in the defined window, these bits will automatically point back to the first pixel in the window. Therefore, there is no need to re-initialize the pointers.

REG[4Ah] Me	REG[4Ah] Memory Read Address Register 0											
Default = 00h	,											
	Memory Read Address bits 7-0											
7	6	5	4	3	2	1	0					

REG[4Ch] Memory Read Address Register 1										
Default = 00h Read/Write										
	Memory Read Address bits 15-8									
7	6	5	4	3	2	1	0			

REG[4Eh] Memory Read Address Register 2 Default = 00h Read/Write									
	1	n/a	,	Memo	ory Read Address bit	18-16			
7	6	5	4	3	2	1	0		

REG[4Eh] bits 2-0 REG[4Ch] bits 7-0

REG[4Ah] bits 7-0 Memory Read Address bits [18:0]

These bits are used for individual memory location reads only. Individual memory location writes are not supported.

After a completed memory access, these bits are automatically incremented.

Note

If 16-bit interface is used (CNF1 = 1), all reads will be on even byte boundaries. Memory Read Address bit 0 is ignored and internally forced to 0b.

10.3.8 Gamma Correction Registers

Note

Gamma correction is implemented as a look-up table. RGB input data (YUV input data is converted to RGB) is used to look-up the values from the programmed tables. The Gamma LUT's are placed on the display read path and the 24-bit output goes to the LCD interface.

Note

The Gamma Correction Tables should not be accessed during display period as this will result in visual anomalies. All updates to the LUTs should be performed during non-display period or when the LUTs are disabled and not in use.

bits 2-1 Look-Up Table Access Mode bits [1:0]

These bits specify the mode used to access the Look-Up Table (LUT).

Table 10-13: Look-Up Table Access Mode

REG[50h] bits 2-1	Description					
00b	Writing is done to all Red, Green, & Blue tables. Reading is done from the Red table.					
01b	Reading and writing are done from/to the Red table.					
10b	Reading and writing are done from/to the Green table.					
11b	Reading and writing are done from/to the Blue table.					

bit 0 Gamma Correction Enable

This bit controls gamma correction.

When this bit = 0, gamma correction is disabled and the input data will bypass the gamma correction look-up table.

When this bit = 1, gamma correction is enabled and the input data will go through the gamma correction look-up table.

Note

The Gamma Correction Tables should not be accessed during display period as this will result in visual anomalies. All updates to the LUTs should be performed during non-display period or when the LUTs are disabled and not in use.

REG[52h] G	REG[52h] Gamma Correction Table Index Register

bits 7-0

Gamma Correction Table Index bits [7:0]

These bits specify the index of the gamma correction look-up table where the subsequent read/write will start.

REG[54h] G	REG[54h] Gamma Correction Table Data Register										
Default = not	Default = not applicable Read/Write										
	Gamma Correction Table Data bits 7-0										
7	6	5	4	3	2	1	0				

bits 7-0

Gamma Correction Table Data bits [7:0]

When writing to these bits, the index to the internal Gamma Correction Table Data is automatically incremented by 1 for each write to the Gamma Correction Table Data register. This allows the continuous writes to the Gamma Correction Table while only having to write the Gamma Correction Table Index, REG[52h], once before the first write.

Note

When performing auto-increment writes, all 256 positions of each LUT must be written.

10.3.9 Miscellaneous Registers

REG[56h] Po		gister					Read/Write
PWRSVE Input Pin Function			Sleep Mode Enable/Disable	Standby Mode Enable/Disable			
7	6	5	4	3	2	1	0

bit 7 PWRSVE Input Pin Function

This bit determines the functionality of the PWRSVE input pin.

When this bit = 0, the PWRSVE pin is OR'd with the Sleep Mode Enable/Disable bit (REG[56h] bit 1) and setting either to 1 will enable Sleep Mode.

When this bit = 1, the PWRSVE pin is OR'd with the Standby Mode Enable/Disable bit (REG[56h] bit 0) and setting either to 1 will enable Standby Mode.

bit 1 Sleep Mode Enable/Disable

This bit controls the Sleep power save mode. Sleep mode can also be controlled by the PWRSVE pin when REG[56h] bit 7 = 0b.

When this bit = 0, Sleep Mode is disabled (normal operation).

When this bit = 1, Sleep Mode is enabled.

When Sleep Mode is enabled, all internal blocks including the PLL are disabled.

When Sleep Mode is disabled, the PLL requires approximately 10ms lock time before any memory access should be attempted. The PLL Lock bit, REG[04h] bit 7, can be read to verify when the PLL becomes stable.

bit 0 Standby Mode Enable/Disable

This bit controls the Standby power save mode. Standby mode can also be controlled by the PWRSVE pin when REG[56h] bit 7 = 1b.

When this bit = 0, Standby Mode is disabled (normal operation).

When this bit = 1, Standby Mode is enabled.

When Standby Mode is enabled, all internal blocks are disabled except for the PLL.

When Standby Mode is disabled, the chip can be accessed immediately.

	REG[58h] Non-Display Period Control / Status Register Default = 00h Read/Write									
Vertical Non- Display Period Status (RO)	Horizontal Non- Display Period Status (RO)	VDP OR'd with HDP Status (RO)	YYC Last Line	n/a	TE Output Pin Enable	TE Output Pin Fund	ction Select bits 1-0			
7	6	5	4	3	2	1	0			

bit 7 Vertical Non-Display Period Status (Read Only)

This bit indicates whether the LCD panel output is in a vertical non-display period (VNDP). VNDP is defined as the time between the last pixel on the last line of one frame to the first pixel on the first line of the next frame.

When this bit = 0, the LCD panel output is in a Vertical Display Period.

When this bit = 1, the LCD panel output is in a Vertical Non-Display Period.

bit 5

bit 6 Horizontal Non-Display Period Status (Read Only)

This bit indicates whether the LCD panel output is in a horizontal non-display period (HNDP). HNDP is defined as the time between the last pixel in line n to the first pixel in line n+1.

When this bit = 0, the LCD panel output is in a Horizontal Non-Display Period. When this bit = 1, the LCD panel output is in a Horizontal Display Period.

VP OR'd with HDP Status (Read Only)

This bit indicates whether the LCD panel is in a display period or a non-display period.

When this bit = 0, the LCD panel is in a Display period.

When this bit = 1, the LCD panel is in either a Horizontal or Vertical Non-Display period.

bit 4 YYC Last Line

This bit indicates the status of the YYC (YUV to YUV Converter). If the Input Data Format is YUV 4:2:0 (REG[2Ah] bits 3-0=1001b), this bit goes high 5 MCLKs after the Intel 80 interface completes writing the last pixel of the current window. The bit goes low once the YYC returns to an idle state. At this point, a new window can be written.

When this bit = 0, the YYC is idle.

When this bit = 1, the YYC is converting YUV 4:2:0 data.

When doing back-to-back window writes with a different dimension or format, and the first window is YUV 4:2:0, this bit must be low (0) before starting to write the second window.

bit 2 TE Output Pin Enable

This bit controls the TE output pin.

When this bit = 0, the TE output pin is disabled. When this bit = 1, the TE output pin is enabled.

bits 1-0 TE Output Pin Function Select bits [1:0]

These bits select which function is indicated by the TE output pin.

Table 10-14: TE Output Pin Function Selection

REG[58h] bits 1-0	TE Output Pin Function
00b	Reserved
01b	Horizontal Non-Display Period
10b	Vertical Non-Display Period
11b	HS OR'd with VS

10.3.10 General Purpose IO Pins Registers

REG[5Ah] General Purpose IO Pins Configuration Register 0 Default =00h											
GPIO7 Configuration	51.151 51.152 51.151 51.152 51.										
7	7 6 5 4 3 2 1										

bits 7-0 GPIO[7:0] Configuration

These bits configure the corresponding GPIO[7:0] pin between inputs or outputs.

When this bit = 0 (normal operation), the corresponding GPIO pin is configured as an input

When this bit = 1, the corresponding GPIO pin is configured as an output.

	REG[5Ch] General Purpose IO Pins Status/Control Register 0 Default = 00h Read/Write									
GPIO7 Status										
7 6 5 4 3 2 1										

bits 7-0 GPIO[7:0] Status

When the corresponding GPIO[7:0] pin is configured as an output (see REG[5Ah]), writing a 1b to this bit drives GPIOx high and writing a 0b to this bit drives GPIOx low.

When the corresponding GPIO[7:0] pin is configured as an input (see REG[5Ah]), a read from this bit returns the raw status of GPIOx.

REG[5Eh] GPIO Positive Edge Interrupt Trigger Register											
Default = 00h Read/Wri											
GPIO7 Positive Edge Interrupt Trigger	GPIO6 Positive Edge Interrupt Trigger	GPIO5 Positive Edge Interrupt Trigger	GPIO4 Positive Edge Interrupt Trigger	GPIO3 Positive Edge Interrupt Trigger	GPIO2 Positive Edge Interrupt Trigger	GPIO1 Positive Edge Interrupt Trigger	GPIO0 Positive Edge Interrupt Trigger				
7	6	5	4	3	2	1	0				

bits 7-0 GPIO[7:0] Positive Edge Interrupt Trigger

This bit determines whether the associated GPIO interrupt is triggered on the positive edge (when the GPIOx pin changes from 0 to 1).

When this bit = 0, the associated GPIO interrupt (GPIO_INT) is not triggered on the positive edge.

When this bit = 1, the associated GPIO interrupt (GPIO_INT) is triggered on the positive edge.

REG[60h] GPIO Negative Edge Interrupt Trigger Register Default = 00h										
GPIO7 Negative Edge Interrupt Trigger	GPIO6 Negative Edge Interrupt Trigger	GPIO5 Negative Edge Interrupt Trigger	GPIO4 Negative Edge Interrupt Trigger	GPIO3 Negative Edge Interrupt Trigger	GPIO2 Negative Edge Interrupt Trigger	GPIO1 Negative Edge Interrupt Trigger	GPIO0 Negative Edge Interrupt Trigger			
7	6	5	4	3	2	1	0			

bits 7-0

GPIO[7:0] Negative Edge Interrupt Trigger

This bit determines whether the associated GPIO interrupt is triggered on the negative edge (when the GPIOx pin changes from 1 to 0).

When this bit = 0, the associated GPIOx interrupt (GPIO_INT) is not triggered on the negative edge.

When this bit = 1, the associated GPIOx interrupt (GPIO_INT) is triggered on the negative edge.

REG[62h] GPIO Interrupt Status Register Default = 00h Reac								
GPIO7 Interrupt Status	GPIO6 Interrupt Status	GPIO5 Interrupt Status	GPIO4 Interrupt Status	GPIO3 Interrupt Status	GPIO2 Interrupt Status	GPIO1 Interrupt Status	GPIO0 Interrupt Status	
7	6	5	4	3	2	1	0	

bits 7-0

GPIO[7:0] Interrupt Status

If GPIOs are configured to generate an Interrupt (see REG[5Eh] and REG[60h]), these status bits will indicate which GPIO generated the interrupt.

To clear the corresponding GPIO[7:0] Interrupt Status bit, write a 1b then a 0b to the bit.

REG[64h] GF Default = FFh		Control Regi	ster				Read/Write			
GPIO7 Pull-down Control										
7	7 6 5 4 3 2 1									

bits 7-0

GPIO[7:0] Pull-down Control

All GPIO[7:0] pins have internal pull-down resistors. These bits individually control the state of the corresponding pull-down resistor.

When the bit = 0, the pull-down resistor for the corresponding GPIO pin is inactive. When the bit = 1, the pull-down resistor for the corresponding GPIO pin is active.

11 Frame Rate Calculation

The following formula is used to calculate the display frame rate.

$$FrameRate = \frac{f_{PCLK}}{(HT) \times (VT)}$$

Where:

 $f_{PCLK} = PClk frequency (Hz)$

HT = Horizontal Total

= Horizontal Display Width + Horizontal Non-Display Period

VT = Vertical Total

= Vertical Display Height + Vertical Non-Display Period

Note

For definitions of panel timing parameters, see Section 7.4, "Display Interface" on page 32.

12 RGB Input Data Conversion

All RGB input data is converted to RGB 8:8:8 and stored as follows. For further information see Section 8, "Memory" on page 37.

Table 12-1: RGB 5:6:5 to RGB 8:8:8 Conversion Memory Format

16 Gamma Correction Look-Up Table Architecture

The following figure is intended to show the display data output path only.

The following diagram shows the architecture for 24 bpp using the LUT.

Figure 16-1: Look-Up Table Architecture (24 bpp using LUT)

16.1 Gamma Correction Programming Example

The following procedure should be used to setup and program the Gamma Correction Look-Up Table.

- Disable the LUTs or only access during a non-display period to avoid visual anomalies.
- Write the register "address" for the Gamma Correction Enable register (REG[50h])
- Write data to set the desired LUT Access Mode (see REG[50h] bits 2-1)
- Write data to set the LUT Index to "x" (auto-increment is already enabled, therefore the Gamma Correction Table Index register "address" does not have to be written)
- Write data to the Gamma Correction Table Data register (data value for Index "x")
- Write data to the Gamma Correction Table Data register (data value for Index "x+1")
- Continue until all 256 positions have been written
- Enable Gamma Correction (REG[50h] bit 0 = 1)

18 SwivelView™

18.1 Concept

Most computer displays are refreshed in landscape orientation – from left to right and top to bottom. Computer images are stored in the same manner. SwivelViewTM is designed to rotate the displayed image on a LCD by 90°, 180°, or 270° in a counter-clockwise direction. The rotation is done in hardware and is transparent to the user for all display buffer writes. By processing the rotation in hardware, SwivelViewTM offers a performance advantage over software rotation of the displayed image.

The actual address translation is performed during the Host Write and the image data is, therefore, stored in memory in it's rotated orientation. Due to this design of the rotation logic, each Window written to the S1D13743 can be independently rotated with respect to each other.

18.2 90° SwivelView

The following figure shows how the programmer sees a 320x480 portrait image and how the image is being displayed. The application image is written to the S1D13743 in the following sense: A–B–C–D. The display is refreshed in the following sense: B-D-A-C.

Figure 18-1: Relationship Between The Screen Image and the Image Refreshed in 90° SwivelView

18.2.1 Register Programming

There are no special programming requirements other than simply enabling the rotation itself (see REG[34h] bits 1-0). All Start Addresses and Line Offsets are automatically calculated by hardware.

18.3 180° SwivelView

The following figure shows how the programmer sees a 480x320 landscape image and how the image is being displayed. The application image is written to the S1D13743 in the following sense: A–B–C–D. The display is refreshed in the following sense: D-C-B-A.

Figure 18-2: Relationship Between The Screen Image and the Image Refreshed in 180° SwivelView

18.3.1 Register Programming

There are no special programming requirements other than simply enabling the rotation itself (see REG[34h] bits 1-0). All Start Addresses and Line Offsets are automatically calculated by hardware.

18.4 270° SwivelView

The following figure shows how the programmer sees a 320x480 portrait image and how the image is being displayed. The application image is written to the S1D13743 in the following sense: A–B–C–D. The display is refreshed in the following sense: C-A-D-B.

Figure 18-3: Relationship Between The Screen Image and the Image Refreshed in 270° SwivelView

18.4.1 Register Programming

There are no special programming requirements other than simply enabling the rotation itself (see REG[34h] bits 1-0). All Start Addresses and Line Offsets are automatically calculated by hardware.

19 Host Interface

19.1 Using the Intel 80 Interface

Accessing the S1D13743 through the Intel 80 host interface is a multiple step process. All Registers and Memory are accessed through the register space.

Note

All Register accesses are 8-bit only, except for the Memory Data Port. If the Host interface is 16-bits wide (CNF1 = 1b), the lsbs (MD[7:0]) are used for all registers except the Memory Data Port.

For the Memory Data Port (REG[48h, 49h]), both registers are used when the host interface is 16-bits wide (CNF1 = 1b) and only REG[48h] is used when it is 8-bits wide (CNF1 = 0b).

First, perform a single "Address Write" to setup the register address. Next, perform a "Data Read/Write" to specify the data to be stored or read from the registers or memory specified in the "Address Write" cycle. Subsequent data read/writes without an Address Write to change the register address, will automatically "auto" increment the register address, or the internal memory address if accessing the Memory Data Port (REG[48h], REG[49h]).

To write display data to a Window Aperture, specify the Window coordinates followed by burst data writes to the Memory Data Port to fill the window. In this sequence, the internal memory addressing is automatic (see examples). The Memory Data Port is located directly following the Window coordinates to minimize the number of Address Writes.

To read display data, perform an Address Write to the Memory Address Port (3 bytes) and then read data from the Memory Data Port. Sequential reads will auto-increment the internal memory address

19.1.1 Register Write Procedure

- 1. Perform an address write to setup register address bits 7-0.
- 2. Perform a data write to update the register.
- 3. Additional data writes can be performed as the register addresses will be auto-incremented.

Figure 19-1: Register Write Example Procedure

19.1.2 Register Read Procedure

- 1. Perform an address write to setup register address bits 7-0.
- 2. Perform a data read to get the register value.
- 3. Additional data reads can be performed as the register addresses will be auto-incremented.

Figure 19-2: Register Read Example Procedure

19.1.3 New Window Aperture Write Procedure

The S1D13743 has a special procedure to minimize setup accesses when bursting window data.

- 1. Set the panel dimension registers before writing any window data.
- 2. Perform an address write to point to the first window register (Window X Start Position Register 0, REG[38h]).
- 3. Perform "data" writes to the next eight, 8-bit registers (REG[38h] ~ REG[46h]). This will setup all the window coordinates.

Note

The register addresses will be auto-incremented after each data write and will point at Memory Data Port Register 0 (REG[48h]) when done.

4. Perform burst data writes to fill the window (the register address will already be pointing at the Memory Data Port).

The Memory Data Port Register is located in the 9th register address after the Window X Start Position. Writes to the Memory Data Port will auto-increment the internal memory address only.

Figure 19-3: Sequential Memory Write Example

19.1.4 Opening Multiple Windows

- 1. Repeat the steps outlined in Section 19.1.3, "New Window Aperture Write Procedure" on page 100 with new window coordinates for each new window.
- 2. Non-pixel doubled windows can overlap with the last one being written considered the top.

19.1.5 Update Window using existing Window Coordinates

- 1. Perform an address write to point to Memory Data Port Register 0 (REG[48h]).
- 2. Perform burst data writes to fill the window.

Note

In this case, the previous coordinates of the Window Aperture are used. Each write to the Memory Data Port will auto-increment the internally memory address only.

19.1.6 Individual Memory Location Reads

Note

This function is for test purposes only and serves no practical use in a system.

- 1. Write the physical address of the memory location to read from to the Memory Read Address Registers (REG[4Ah] ~ REG[4Eh]). For a 16-bit bus, the LSB of this address is ignored.
- 2. Perform a read from the Memory Data Port (REG[48h] ~ REG[49h]).
- 3. Continuous reads from the Memory Data Port will cause the address in the Memory Read Address registers to increment, thereby supporting burst reads.

Note

To access the 8 lsb's for each 24-bit value, you must know the physical address as they are stored at different locations as compared to the upper 16-bits.

20 Double Buffering

20.1 Double Buffer Controller

Double buffering is provided to prevent tearing of streaming video data. All static (non-video) image data will always be written to the upper half (Buffer 1) of the frame buffer. When video is being input, the first frame will be written to the lower half (Buffer 2) of the double buffer. The second frame will be written to Buffer 1. While video data is being input, the static part of the image going to the LCD will still always come from Buffer 1. The source of the video window will come from either Buffer 1 or Buffer 2, depending on which one was the last to be completely updated.

The switching of the buffer read/write pointers can only occur once per frame, at the beginning of the vertical non-display period. The pointers will only switch if: a video frame had completed being updated within the last output frame period, and no new video frame is currently being written. Because of this, each time the user finishes writing a frame of video data, they should wait until the next vertical non-display period before writing the next frame. This can be accomplished by using the TE pin or by polling the Vertical Display Period Status (REG[58h] bit 7). Alternatively, if the user can guarantee that the maximum input video frame rate is 1/2 the LCD frame rate and that the burst length for writing a video frame is less than one LCD frame period, then no checking for the vertical non-display period is required. If attention is not paid to allowing the pointers to switch, then frames may be dropped.

Figure 20-1: Switching of Buffer Pointers

To use the double buffer feature:

- Set appropriate bits in the Special Effects Register, REG[36h] bits 7-6 to 11b.
- Setup the Window Position Registers, REG[38h] ~ REG[46h].
- Write the video data to the Memory Data Port, REG[48h] ~ REG[49h].

It is also possible to update a static window while double buffering is enabled, even in the middle of a video stream. To do this:

- Write the last pixel of the current frame of video data.
- Set the appropriate bits in the Special Effects Register, REG[36h] bits 7-6 to 01b.
- Setup the Window Position Registers, REG[38h] ~ REG[46h].
- Write the static data to the Memory Data Port, REG[48h] ~ REG[49h].

This allows a static image to be written at any time, while still preventing the double buffered window from tearing. Once the static window has been written, the user can go back to writing the streaming video data by following the steps described above for using the double buffer feature.

Figure 20-2: Double Buffer Example

20.2 Double Buffering Limitations

There are some limitations to double buffering:

- Consider the case where there is a video stream being input and the user wants to place a static PIP over all or some part of the video window. The user can write the PIP, but when the video stream is continued, it will destructively overwrite the PIP, so that it will appear as though the PIP is under the video window.
- Consider the case where there is a video stream which stops after the last frame of video is sent. The final frame of video will continue to be displayed on the LCD. Assume that this last frame is stored in Buffer 2. Now, if the user disables double buffering, the buffer read pointer will immediately reset to Buffer 1. This means that the 2nd to last frame will now be displayed instead of the last frame.
- The user must either wait for a vertical non-display period between writing frames of video data, or guarantee that their maximum input frame rate is 1/2 the LCD frame rate and that the length of time it takes to burst write a frame of video data is less than one LCD frame period.
- Only one window can be double buffered at a time.

21 Interfacing the S1D13743 and a TFT Panel

This section describes the hardware and software environment required to interface the S1D13743 Mobile Graphics Engine and a 352x416 TFT Panel.

The designs described in this section are presented only as examples of how such interfaces might be implemented.

21.1 Overview

The S1D13743 was designed to directly support the Sanyo LC13015 and requires no additional hardware and minimal programming. The S1D13743 register settings and electrical interface is described below.

21.1.1 Electrical Interface

Table 21-1: Pin Mapping

S1D13743 Pin Name	S1D13743 Pin Number	LCD13015 Pin Name
HS	D9	HS
VS	D10	VS
PCLK	D11	PCLK
DE	C11	DE
VD[17:0]	J8, J9, J10, J11, K4, K5, K6, K7, K8, K9, K10, L3, L4, L5, L6, L7, L8, L9	R5, R4, R3, R2, R1, R0, G5, G4, G3, G2, G1, G0, B5, B4, B3, B2, B1, B0

21.1.2 S1D13743 Register Settings for 352x416 TFT Panel

Note

The registers listed below are only those associated with panel specific timing issues All other registers are not shown here.

Note

When a window is setup for YUV data, the data must always alternate between odd and even lines, starting with an odd line.

Table 21-2: Example Register Settings for 352x416 TFT Panel

Register	Value	Comment	
All	default	Come out of reset - all registers set to default values	
REG[56h]	02h	enter sleep mode (or use PWRSVE pin)	
REG[04h]	12h	set PLL M-Divider. CLKI = 19.2MHz, PLL input clock = CLKI/19 = 1.01MHz.	
REG[06h]	F8h		
REG[08h]	80h		
REG[0Ah]	28h		
REG[0Ch]	00h		
REG[0Eh]	2Fh	LL = 48, resulting SYSCLK = LL x PLL input clock = 48MHz	
REG[12h]	19h	set PCLK divide, PCLK = 12.1MHz set SYSCLK source = PLL	
REG[14h]	0h	no panel data swap, 18-bit panel	
REG[16h]	2Ch	HDP = 352 pixels	
REG[18h]	5Ah	HNDP = 90 pixels	
REG[1Ah]	A0h	VDP = 416 lines	
REG[1Ch]	01h		
REG[1Eh]	06h	VNDP = 6 lines	
REG[20h]	14h	HS Pulse Width = 20 pixels	
REG[22h]	2Dh	HS Start Position = 45 pixels	
REG[24h]	02h	VS Width = 2 lines	
REG[26h]	01h	VS Start Position (VFP) = 1 line	
REG[28h]	80h	PCLK Polarity: data output on falling edge	
REG[2Ah]	01h	set input data mode to RGB 5:6:5	
REG[56h]	00h	disable sleep mode	
REG[04h] bit 7	_	wait for PLL to lock - poll REG[04h] bit 7	
REG[38h]	00h	Window X Start Position = 0	
REG[3Ah]	00h	VVIIIUOW A Start FUSITION = 0	
REG[3Ch]	00h	Window V Start Position - 0	
REG[3Eh]	00h	Window Y Start Position = 0	
REG[40h]	5Fh	Window X End Position = 351	
REG[42h]	01h	VVIIIdow A Elid Fosition = 331	

Table 21-2: Example Register Settings for 352x416 TFT Panel (Continued)

Register	Value	Comment	
REG[44h]	9Fh	-Window Y End Position = 415	
REG[46h]	01h		
REG[48h]	Write the image data to the Memory Data Port, REG[48h] and REG[49h]. The image		
REG[49h]	will immediately begin to appear on the LCD.		

Note

The above values are intended as examples. This example assumes that CLKI = 19.2MHz and that the PLL is used to generate SYSCLK. Actual settings can vary and still remain within the LCD panel timing requirements.

21.2 Host Bus Timing

Note: The D/C# input pin is used to distinguish between Address and Data.

Note: The register address will auto-increment in word increments for all register access except the Gamma Correction Table Data register and Memory Data Port. Writes to the Gamma Correction Table Data register and Memory Data Port will not increment the register address to support burst data writes to the gamma correction table and to memory.

Figure 21-1: Intel 80 Input A.C. Characteristics

x 46 ($EY >> 8)
```

22 PLL Power Supply Considerations

The PLL circuit is an analog circuit which is very sensitive to noise on the input clock waveform or the power supply. Noise on the clock or the supplied power may cause the operation of the PLL circuit to become unstable or increase the jitter.

Due to these noise constraints, it is highly recommended that the power supply traces or the power plane for the PLL be isolated from those of other power supplies. Filtering should also be used to keep the power as clean as possible.

The following are guidelines which, if followed, will result in cleaner power to the PLL, this will result in a cleaner and more stable clock. Even a partial implementation of these guidelines will give results.

22.1 Guidelines for PLL Power Layout

The PLL circuit is an analog circuit and is very sensitive to noise on the input clock waveform or the power supply. Noise on the clock or the supplied power may cause the operation of the PLL circuit to become unstable or increase the jitter.

Due to these noise constraints, it is highly recommended that the power supply traces or the power plane for the PLL be isolated from those of other power supplies. Filtering should also be used to keep the power as clean as possible.

The following are guidelines which, if followed, will result in cleaner power to the PLL, resulting in a cleaner and more stable clock. Even a partial implementation of these guidelines will give results.

Figure 22-1: PLL Power Layout

- Place the ferrite beads (L1 and L2) parallel to each other with minimal clearance between them. Both bypass caps (C2 and C3) should be as close as possible to the inductors. The traces from C3 to the power planes should be short parallel traces on the same side of the board with just the normal small clearance between them. Any significant loop area here will induce noise. If there is a voltage regulator on the board, try to run these power traces directly to the regulator instead of dropping to the power planes (still follow above rules about parallel traces).
- The analog ground point where bypass cap (C2) connects to the ground isolation inductor (L2) becomes the analog ground central point for a ground star topology. None of the components connect directly to the analog ground pin of the MGE (PLLV_{SS}) except for a single short trace from C2 to the PLLV_{SS} pin. The ground side of the large bypass capacitor (C1) should also have a direct connection to the star point.
- The same star topology rules used for analog ground apply to the analog power connection where L2 connects to C2.
- All of the trace lengths should be as short as possible.
- If possible, have all the PLL traces on the same outside layer of the board. The only exception is C1, which can be put on the other side of the board if necessary. C1 does not have to be as close to the analog ground and power star points as the other components.
- If possible, include a partial plane under the PLL area only (area under PLL components and traces). The solid analog plane should be grounded to the C2 (bypass) pad. This plane won't help if it is too large. It is strictly an electrostatic shield against coupling from other layers' signals in the same board area. If such an analog plane is not possible, try to have the layer below the PLL components be a digital power plane instead of a signal layer.
- If possible, keep other board signals from running right next to PLL pin vias on any layer.
- Wherever possible use thick traces, especially with the analog ground and power star connections to either side of C2. Try to make them as wide as the component pads – thin traces are more inductive.

It is likely that manufacturing rules will prohibit routing the ground and power star connections as suggested. For instance, four wide traces converging on a single pad could have reflow problems during assembly because of the thermal effect of all the copper traces around the capacitor pad. One solution might be to have only a single trace connecting to the pad and then have all the other traces connecting to this wide trace a minimum distance away from the pad. Another solution might be to have the traces connect to the pad, but with thermal relief around the pad to break up the copper connection. Ultimately the board must also be manufacturable, so best effort is acceptable.

421-8, Hino, Hino-shi, Tokyo 191-8501, JAPAN Phone: +81-42-587-5814 FAX: +81-42-587-5117

25.1 Ordering Information

To order the S1D13743 Mobile Graphics Engine, contact the Epson sales representative in your area.

Change Record

X70A-A-001-02 Revision 2.8 - Issued: 2012/02/29

globally delete FCBGA-121 ball package

X70A-A-001-02 Revision 2.7 - Issued: 2010/05/18

- section 4.2.3 Clocks remove "Input frequency range: 1MHz ~ 33MHz" from CLKI description
- section 7.1.1 Input Clocks in table 7-1 Clock Input Requirements (CLKI), change fosc Input clock frequency PLL used for System Clock max value to "33" from "66"

X70A-A-001-02 Revision 2.6 - Issued: 2009/09/29

- all changes from the last revision are highlighted in Red
- section 6.3 Electrical Characteristics in Table 6-4, change Operational Peak Current max value to "74 uA"
- section 7.4.3 Generic 18/24-Bit TFT Panel Timing in figure 7-10, 18/24-Bit TFT A.C. Timing, remove references to 1 pixel/clock and 2 pixel/clock modes, remove VD[23:0] timing waveform, add VD[23:0] to VD[17:0] timing waveform
- section 8 Memory for Tables 8-1 and 8-2, change red data to odd addresses and green data to even addresses
- section 9.4 Setting SYSCLK and PCLK add CLKI information to this section
- section 9.4 Setting SYSCLK and PCLK remove "5 x 9.5" from "For example, if the..."
- section 23 in Figure 23-1, change Side View ball height to 0.23mm
- section 26 Sales and Technical Support changes to Epson offices and addresses

X70A-A-001-02 Revision 2.5 - Issued: 2008/05/07

- all changes from the last revision are highlighted in Red
- Set revision to 2.5 to align with Japan revision numbering
- section 8 Memory add this section and renumber all following sections
- REG[48h] ~ REG[49h] remove "The data read back from memory will be byte swapped (i.e. if 12 34 56 78 is written to memory, data read back will be 34 12 78 56)" from the first note
- REG[4Ah] ~ REG[4Eh] add note "If 16-bit interface is used (CNF1 = 1), all reads will..."
- section 12 RGB Input Data Conversion delete paragraph "The actual data storage is complex due to the memory structure..." and add reference to section 8

X70A-A-001-02 Revision 2.04 - Issued: 2007/09/18

• all changes from the last revision of the spec are highlighted in Red

S1D13743 X70A-A-001-02

- section 7.3.1 ~ 7.3.2, added note and clarified the usage of MD[15:8] pins in the Host Timing figures and tables
- section 18.1.3, updated the X/Y Start/End data order in the Sequential Memory Write Example Sequence figure and moved it to section 18.1.3
- section 24, added References
- section 25, added Sales and Technical Support addresses

X70A-A-001-02

Revision 2.03 (Issued 2006/09/25)

- all changes from the last revision of the spec are highlighted in Red
- section 11 RGB Input Data Conversion add this section and re-number following sections

X70A-A-001-02

Revision 2.02 (Issued 2006/08/23)

- all changes from the last revision of the spec are highlighted in Red
- globally add QFP20 144-pin package information
- section 4.2.4 Miscellaneous change PWRSVE pin Powersave status to "Pull-down Active" and change description to "This pin has an internal..."
- section 5.2 LCD Interface Data Pins correct typos in table 5-3, change Hi-Z to Driven Low
- section 6.3 Electrical Characteristics add table 6-4 Electrical Characteristics for IOVDD or PIOVDD = $3.3V \pm 0.3V$
- section 7.2 RESET# Timing add CLKI signal to figure
- section 7.3.1 Intel 80 Interface Timing 1.8 Volt rewrite section for 1.8 volts
- section 7.3.2 Intel 80 Interface Timing 3.3 Volt add this section

X70A-A-001-02

Revision 2.01 (Issued 2006/04/28)

- all changes from the last revision of the spec are highlighted in Red
- updated EPSON tagline
- section 4.2.1 Intel 80 Host Interface for GPIO_INT add reference to General Purpose IO Pins Registers to pin description.
- section 4.2.4 Miscellaneous for GPIO[7:0] rewrite pin description, for PWRSVE rewrite pin description for no pull-down resistor
- section 4.2.4, change SCANEN pin description IO Voltage from "VSS" to "IOVDD"
- section 7.2 RESET# Timing add this section
- section 17.1.2, for the Host Interface section changed the references in the figure from "D[15:0]" to "MD[15:0]"

X70A-A-001-02

Revision 2.0

 section 6.3 Electrical Characteristics - in table 6-3, define the conditions for Quiescent Current

X70A-A-001-01

Revision 1.07

- All changes from the previous Revision are in red
- section 7.3.3 Generic 18/24-Bit TFT Panel Timing correct typos in section, change 36bit to 24-bit, change VD[35:0] to VD[23:0] in figure

X70A-A-001-01

Revision 1.06

- All changes from the previous Revision are in red text
- section 6.3 Electrical Characteristics table 6-3 Electrical Characteristics for IOVDD or PIOVDD = $1.8V \pm 0.15V$, break P_{Total} out to separate power types (P_{CORE} , P_{PLL} , P_{PIO} , P_{HIO}) and make change to note under table

X70A-A-001-01

Revision 1.05

- figure 21-2 S1D13743 Package Marking add process condition change to Package Revision Code
- table 21-1 S1D13743 Product Marking add ES information to table
- section 22 ESD Test Results add this section

X70A-A-001-01

Revision 1.04

 section 6.3 Electrical Characteristics - add max value for I_{CORE} and rewrite note at bottom of table

X70A-A-001-01

Revision 1.03

 section 21 Mechanical Data - Table 21-1 S1D13743 Product Marking, correct typo in second row first column - change TS1 to TS2

X70A-A-001-01

Revision 1.02

section 21 Mechanical Data - add Table 21-1 S1D13743 Product Marking

X70A-A-001-01

Revision 1.01

section 21 Mechanical Data - add Figure 21-2 S1D13743 Package Marking

X70A-A-001-01

Revision 1.0

Release as Revision 1.0 (2005/01/18)

X70A-A-001-00

Revision 0.07

- section 4.2.2 LCD Interface change PCLK RESET# State to CLKI
- section 6 D.C. Characteristics add PIOVDD to tables and update Table 6-3 Electrical Characteristics, change section 6.2 note "There are no special Power On/Off requirements..." and add section 6.3 note "1. Typical Operating Current Environment..."
- section 7.3.3 18/24-Bit TFT Panel Timing add t17 and t18 to figure and table, remove t3 min and max, change t3 typ to "HPS", and correct typo t8 typ to "HPS" from "HSS" in table

- section 8.4 Setting SYSCLK and PCLK change first equation to "14.94ns < T_{SYSCLK} < (T_{BBC} 0.976) x 0.485ns" from "14.94ns < T_{SYSCLK} < (T_{BBC} 0.976) \div 2.06ns"
- REG[04h] change register name from "PLL M-Divider Register 0" to "PLL M-Divider Register"
- REG[18h] change minimum register value in note to 3
- REG[2Ah] add note "For YUV 4:2:2 and YUV 4:2:0 settings, the width..."
- REG[2Ah] add note "RGB 6:6:6 mode 2 and RGB 8:8:8 mode 2..."
- REG[34h] bits 6-4 for 000b change FRM Mode Selected to Normal Mode, and add note "When the output is 24 bpp..."
- REG[36h] bit 7 add note "While double buffering is enabled..."
- REG[36h] bit 6 add note "While double buffering is enabled..."
- REG[48h] ~ REG[49h] add note "Data read back from memory will be byte swapped"
- REG[56h] bit 1, fixed reference to REG[56h] bit 7 state, should be "Sleep mode can also be controlled by the PWRSVE pin when REG[56h] bit 7 = 0b." instead of "Sleep mode can also be controlled by the PWRSVE pin when REG[56h] bit 7 = 1b."
- REG[56h] bit 0, fixed reference to REG[56h] bit 7 state, should be "Standby mode can also be controlled by the PWRSVE pin when REG[56h] bit 7 = 1b." instead of "Standby mode can also be controlled by the PWRSVE pin when REG[56h] bit 7 = 0b."
- REG[58h] bit 6 swap "When this bit =..." descriptions
- REG[58h] bit 5 rename bit to "VP OR'd with HDP Status (Read Only)"
- section 12 Intel 80, 16-bit Interface Color Formats remove color from all Figures in section
- section 13 YUV Timing add format definition to this section
- section 13 YUV Timing remove color from all Figures in section
- section 13.1 YUV 4:2:2 with Intel 80, 8-bit Interface, figure 13-1, correct U, V figure
- section 15 Display Data Format Table 15-3 18-Bit Data Format (Non-Swapped, REG[14h] bit 7 = 0b), and Table 15-4 18-Bit Data Format (Swapped, REG[14h] bit 7 = 1b) change VD[23:18] value from Hi-Z to Low
- section 19.1.2 S1D13743 Register Settings for 352x416 TFT Panel change REG[06h] value to F8h and REG[0Ah] value to 28h
- section 19.1.2 S1D13742 Register Settings for 352x416 TFT Panel add note "When a window is setup for YUV data..."

X70A-A-001-00 Revision 0.06

- figure 4-1, changed "S1D13743 Proposed Pinout..." to "S1D13743 Pinout..."
- section 7.1.1 Input Clocks Table 7-1 Clock Input Requirements (CLKI) change fOSC Input clock frequency - PLL used for System Clock max to 66 MHz

- section 7.3, corrected the formulas for HNDP (should be "REG[18h] bits 6-0" instead of "REG[18h] bits 5-0"), HSW (should be "REG[20h] bits 6-0" instead of "REG[20h] bits 5-0"), and VSW (should be "REG[24h] bits 5-0" instead of "REG[24h] bits 6-0")
- section 7.3.1, added information about PWRSVE pin to TFT Power-On sequence note 1
- section 7.3.1, in second note changed LCD pins VD[35:0] to VD[23:0]
- section 7.3.2, added information about PWRSVE pin to TFT Power-Off sequence note 1
- section 7.3.2, in second note changed LCD pins VD[35:0] to VD[23:0]
- section 7.3.3, added 18-bit panel data (VD[17:0])
- section 7.3.3, fixed REG reference for PCLK Polarity, should be "REG[28h] bit 7" instead of "REG[2Ah] bit 7"
- section 8.1, removed arrow pointing down from the Clock Source Select
- section 9.2, added register set summary table
- REG[04h] bits 5-0, updated the M-Divide Ratio table to read "REG[04h] bits 5-0" instead of "bits 6-0" and changed the maximum value from 7Fh to 3Fh
- REG[06h] ~ REG[0Ch], changed the bit descriptions for the PLL Setting Registers 0-3, reserved all individual bit descriptions and added specific programming values for each register
- REG[14h] bit 7, combined the note under the VD Data Swap bit into the main bit description and added references to the exact tables
- REG[2Ah] remove text "bit 7-4 Reserved"
- REG[2Ch] bit 6, updated the YRC Reset bit description
- REG[34h] bit 7, updated the Display Blank bit description
- REG[48h] ~ REG[49h], changed the default value for the Memory Data Port Registers to "not applicable"
- REG[54h], changed the default value for the Gamma Correction Table Data Register to "not applicable"
- REG[58h] bit 4, updated the YYC Last Line bit description and removed reference to the MESSI interface (should be Intel 80 interface)
- REG[5Ah] ~ REG[64h], minor wording clarifications to the GPIO registers
- section 10, changed "Horizontal Period" to "Horizontal Display Width" and "Vertical Period" to "Vertical Display Height"
- section 10, added cross reference to Display Interface timing section for Panel Timing Parameter definitions
- section 11, updated the Intel 80, 8-bit Interface Color Formats diagrams to use the proper 13743 pin names
- section 12, updated the Intel 80, 16-bit Interface Color Formats diagrams to use the proper 13743 pin names

- section 13, updated the YUV Timing diagrams to use the proper 13743 pin names
- section 14, added data input to LUT
- section 14.1, reworded some of the steps in the Gamma Correction Programming Example
- section 17, minor wording changes to clarify the Host Interface usage examples

X70A-A-001-00

Revision 0.05

- section 7.1.1 Input Clocks Table 7-1 Clock Input Requirements (CLKI) change Input clock frequency - PLL max to 66.53 MHz, and Input clock frequency - CLKI max to 68.59 MHz.
- section 7.1.2 PLL Clock change all PLL output min to 44.28 MHz. and all PLL output max to 66.53 MHz,
- section 7.2.1 Intel 80 Interface Timing Table 7-3 Intel 80 Input A.C. Characteristics change t_{odh} min to 11.0, and t_{ddt} min to 2.7 and max to 18.0
- section 8.4 Setting SYSCLK and PCLK change first equation to "15.03ns < T_{SYSCLK} < (T_{BBC} 0.976) \div 2.06 ns", second equation to "15.03ns < T_{SYSCLK} < 22.584ns", and third equation to "44.28MHz < f_{SYSCLK} < 66.53MHz"

X70A-A-001-00

Revision 0.04

- section 2.6 Display Features -change third bullet text paragraph "... must fit inside 232K bytes..." to "... must fit inside 228K bytes..."
- section 7.1.1 Input Clocks Table 7-1 Clock Input Requirements (CLKI) change f_{OSC} Max, t3 max, t4 max, t5 min/max, t6 min/max, add note 6
- section 7.1.2 PLL Clock Figure 7-2 PLL Start-Up Time, Table 7-2 PLL Clock Requirements - change PLL output to min 44.26, max 66.95
- section 7.2.1 Intel 80 Interface Timing Table 7-3 Intel 80 Input A.C. Characteristics change t_{odh} and t_{ddt} min and max
- section 8.4 Setting SYSCLK and PCLK replace numbers in equations with new, replace Figure 8-3 Setting of SYSCLK for a Desired PCLK
- section 9 Registers correct register address typos in introduction
- section 9.1 Register Mapping- correct register address typos
- REG[18h] add to note "Minimum value of this register = 4 Pixels"
- REG[34h] add bits 6-3 and change register default to 08h
- REG[54h] change register default to ??h
- section 17 Host Interface correct register address typos in introduction note
- section 17.1.5 Individual Memory Location Reads delete step 1 and re-number steps, changes to note

X70A-A-001-00

Revision 0.03

• Engineering changes added

X70A-A-001-00

Revision 0.01

• initial draft of the S1D13743 specification
